Background of the Invention

Isoprenoid compounds are organic molecules produced by a wide range of organisms (e.g., plants, bacteria, fungi, etc). To date, over 23,000 individual isoprenoid molecules have been characterized with tens to hundreds of new structures identified each year. These molecules can fulfill a variety of roles. For example, monoterpenes can be used as fragrances and flavors. Sesquiterpenes and diterpenes can serve as pheromones, defensive agents, visual pigments, antitumor drugs, and components of signal transduction pathways. Triterpenes can serve important functions as membrane constituents and precursors of steroid hormones and bile acids. Polyprenols function as photoreceptive agents and cofactor side chains, and can also exist as natural polymers.

The diverse molecular compounds produced by the isoprenoid pathway are created from diphosphate esters of monounsaturated isoprene units. Isoprenes are added together in multiples of 2, 3, or 4 by prenyl transferases to make C₁₀, C₁₅, and C₂₀ units, respectively. The C₁₀, C₁₅, and C₂₀ molecules, named geranyl diphosphate (GPP), farnesyl diphosphate (FPP), and geranylgeranyl diphosphate (GGPP), respectively, serve as substrates for terpene synthases.

Terpene synthases catalyze the production of isoprenoid compounds via one of the most complex reactions known in chemistry or biology. In general, terpene synthases are moderately sized enzymes having molecular weights of about 40 to 100 kD. As an enzyme, terpene synthases can be classified as having low to moderate turnover rates coupled with exquisite reaction specificity and preservation

of chirality. Turnover comprises binding of substrate to the enzyme, establishment of substrate conformation, conversion of substrate to product and product release.

Reactions can be performed in vitro in aqueous solvents, typically require magnesium ions as cofactors, and the resulting products, which are often highly hydrophobic, can be recovered by partitioning into an organic solvent.

Terpene synthase genes are found in a variety of organisms including bacteria, fungi and plants. Swapping regions approximating exons between different terpene synthases has identified functional domains responsible for terminal enzymatic steps. For example, work performed on 5-epi-aristolochene synthase (TEAS) from Nicotiana tabacum (tobacco) and Hyoscyamus muticus vetispiradiene synthase (HVS) from henbane revealed that exon 4 and exon 6, respectively, were responsible for reaction product specificity. Combining functional domains resulted in novel enzymes capable of synthesizing new reaction products (U.S. Patent 5,824,774).

10

Studies have led to proposed reaction mechanisms for isoprenoid production; see, e.g., Cane et al., 1985, Bioorg. Chem.,13:246-265; Wheeler and Croteau, 1987, Proc. Natl. Acad. Sci. USA, 84:4856-4859; and Pyun et al., 1994, Arch. Biochem. Biophys., 308:488-496. The studies used substrate analogs and suicide inhibitors (Croteau, 1994, Arch. Biochem. Biophys., 251:777-782; Cane et al., 1995, Biochemistry, 34:2471-2479; and Croteau et al., 1993, Arch. Biochem. Biophys., 307:397-404), as well as chemical-modifying reagents and site-directed mutagenesis in efforts to identify amino acids essential for catalysis (Cane et al., 1995, Biochemistry, 34:2480-2488; Rajaonarivony et al., 1992, Arch. Biochem. Biophys., 296:49-57; and Rajaonarivony et al., 1992, Arch. Biochem. Biophys., 299:77-82). However, these studies have resulted in limited success in defining the active site due to inherent limitations with these techniques.

25

Summary of the Invention

The invention describes a method of identifying alpha-carbon atoms found in the active site of a terpene synthase and describes these atoms in three-dimensional space as well as the spatial relationships among them. The present invention also describes R-groups associated with such alpha-carbons and methods of altering these R-groups in order to create novel terpene synthases capable of generating novel reaction products.

35

Until the invention taught in this present application, the active site of synthase proteins, the amino acid residues located therein, the amino acid residues involved in catalysis, and the configuration of α -carbons and R-groups within the

10

15

20

25

30

35

active site have not been known. The current invention now teaches the structure of synthases, as well as provides the means of making and using the information obtained therefrom to develop and produce new and novel synthases having new and novel synthetic capabilities. The data generated using the methods described herein are useful for creation and production of synthase mutants that can use a variety of isoprenoid substrates and produce a variety of isoprenoid products.

In one embodiment, the invention features an isolated terpene synthase having about 20% or greater sequence identity to residues 265 to 535 of SEQ ID NO: 2. Such a synthase comprises nine α-carbons having interatomic distances in Angstroms between the α-carbons that are ±2.3 Angstroms of the interatomic distances shown in Table 6. The center point of each α -carbon is positioned within a sphere having a radius of 2.3 Angstroms. The center point of each such sphere has the structural coordinates given in Table 5. Each α-carbon has an associated R-group, and the synthase has an ordered arrangement of Rgroups associated with each alpha-carbon other than the ordered arrangements of R-groups shown in Table 9. The synthase can have about 25% or greater sequence identity to residues 265 to 535 of SEQ ID 2, or about 35% or greater sequence identity to residues 265 to 535 of SEQ ID 2. Such a synthase can catalyse the formation of a terpenoid product from a monoterpene substrate, a sesquiterpene substrate, or a diterpene substrate. The product can be a cyclic terpenoid hydrocarbon or an acyclic terpenoid hydrocarbon. Either type of product can be hydroxylated or non-hydroxylated. The R-group associated with α-carbon 1 can be selected from one of the following groups: the group consisting of Cys, Ser, and Thr. the group consisting of Phe, Tyr and Trp, the group consisting of Pro, Gly, and Ala, the group consisting of Glu and Asp, the group consisting of Met, Ile, Val and Leu. the group consisting of Arg and Lys, and the group consisting of Gln, Asn and His. R-groups associated with α-carbons 2 to 9 can be any amino acid except those having the ordered arrangements of Table 9. Similarly, the R-group associated with each of α -carbons 2-9 can be selected independently from the group consisting of Cys, Ser and Thr, the group consisting of Phe, Tyr and Trp, the group consisting of Pro, Gly, and Ala, the group consisting of Glu and Asp, the group consisting of Met, lle, Val and Leu, the group consisting of Arg and Lys, and the group consisting of Gln, Asn and His. In these embodiments, R-groups associated with the remaining eight α -carbons except those having the ordered arrangements of Table 9.

In some embodiments, the ordered arrangement of R-groups associated with α -carbons 1 to 9 is Trp, Ile, Thr, Tyr, Leu, Cys, Thr and Phe, respectively, Ser, Ile, Thr, Tyr, Leu, Cys, Thr and Tyr, respectively, Trp, Ile, Thr,

10

15

20

25

30

35

Thr, Tyr, Leu, Trp, Thr and Tyr, respectively, Ser, Ile, Thr, Thr, Tyr, Leu, Trp, Thr and Tyr, respectively, or Glu, Ile, Thr, Tyr, Leu, Cys, Thr and Tyr, respectively.

The invention also features a terpene synthase made by aligning the primary amino acid sequence of a preselected terpene synthase polypeptide to the amino acid sequence of residues 265 to 535 of SEQ ID NO: 2, mutating a nucleic acid encoding the preselected polypeptide at one or more codons for nine amino acid residues in a region of the polypeptide primary amino acid sequence having about 20% or greater sequence identity to residues 265 to 535 of SEQ ID NO: 2, the nine residues in the polypeptide aligning with residues 273, 294, 402, 403, 404, 407, 440, 519 and 520 of SEQ ID NO: 2; and expressing the mutated nucleic acid so that a mutated terpene synthase is made.

The invention also features an isolated terpene synthase having about 20% or greater sequence identity to residues 265 to 535 of SEQ ID NO: 2, the synthase comprising sixteen α-carbons having interatomic distances in Angstroms between the α-carbons that are ±2.3 Angstroms of the interatomic distances given in Table 4. The center point of each α -carbon is positioned within a sphere having a radius of 2.3 Angstroms. The center point of each of the spheres has the structural coordinates given in Table 3. Each α-carbon has an associated R-group, and the synthase has an ordered arrangement of R-groups other than the ordered arrangements of R-groups given in Table 8. The synthase can have about 25% or greater sequence identity to residues 265 to 535 of SEQ ID NO: 2, or about 35% or greater sequence identity to residues 265 to 535 of SEQ ID NO: 2. The synthase can catalyse the formation of a terpenoid product from a monoterpene substrate, a sesquiterpene substrate, or a diterpene substrate. The product can be, for example, a cyclic terpenoid hydrocarbon. The ordered arrangement of R-groups in the synthase associated with α -carbons 1 to 16 can be Cys, Trp, IIe, IIe, Ser, Thr, Thr, Tyr, Leu, Cys, Val, Thr, Tyr, Asp, Phe and Thr, respectively.

The invention also features an isolated terpene synthase having about 20% or greater sequence identity to residues 265 to 535 of SEQ ID NO: 2, the synthase comprising nineteen α -carbons having interatomic distances in Angstroms between the α -carbons that are ± 2.3 Angstroms of the interatomic distances given in Table 2. The center point of each α -carbon is positioned within a sphere having a radius of 2.3 Angstroms. The center points of each sphere have the structural coordinates given in Table 1. Each α -carbon has an associated R-group, and the synthase has an ordered arrangement of the R-groups other than the ordered arrangements of R-groups given in Table 7. The synthase can have about 25% or greater sequence identity to residues 265 to 535 of SEQ ID NO: 2, or about 35% or

10

15

20

25

30

35

greater sequence identity to residues 265 to 535 of SEQ ID NO: 2. The synthase can catalyse the formation of a terpenoid product from a monoterpene substrate, a sesquiterpene substrate, or a diterpene substrate. The product can be, for example, a cyclic terpenoid hydrocarbon.

The invention also features an isolated protein comprising a first domain having an amino terminal end and a carboxyl terminal end. The first domain comprises amino acids that align structurally in three-dimensional space with a glycosyl hydrolase catalytic core, the glycosyl hydrolase catalytic core selected from the group consisting of amino acids 36 to 230 of glucoamylase protein databank (PDB) code 3GLY of Aspergillus awamori and amino acids 36 to 230 of endoglucanase CelD PDB code 1CLC. The isolated protein also comprises a second domain having an amino terminal end and carboxyl terminal end. The second domain comprises amino acids that align structurally in three-dimensional space with avian FPP synthase. The carboxyl terminal end of the first domain is linked to the amino terminal end of the second domain. The second domain has about 20% or greater sequence identity to residues 265 to 535 of SEQ ID NO: 2, and comprises nine α-carbons having interatomic distances in Angstroms between the αcarbons that are ±2.3 Angstroms of the interatomic distances given in Table 6. The center point of each α-carbon is positioned within a sphere having a radius of 2.3 Angstroms, the center point of each sphere having the structural coordinates given in Table 5. Each α -carbon has an associated R-group, and the synthase has an ordered arrangement of R-groups other than the ordered arrangements of R-groups given in Table 9. The protein can have about 25% or greater sequence identity to SEQ ID NO: 2, or about 35% or greater sequence identity to SEQ ID NO: 2. The synthase can catalyse the formation of a terpenoid product from a monoterpene substrate, a sesquiterpene substrate, or a diterpene substrate. The product can be, for example, a cyclic terpenoid hydrocarbon.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 343 to 606 of SEQ ID NO: 20, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 348, 351, 372, 375, 376, 454, 479, 480, 481, 482, 485, 519, 523, 597, 600, 601, 605, 607 and 608 of SEQ ID NO: 20 are residues other than amino acids Y, L, C, I, T, Y, S, C, G, H, S, L, G, F, G, Y, D, Y and S, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 316 to 586 of SEQ ID NO: 22, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 321, 324, 345, 348, 349, 427, 452, 453, 454, 455, 458, 492, 496, 569, 572, 573, 577, 579 and 580 of SEQ ID NO: 22 are residues other than amino acids C, W, N, I, T, Y, S, I, S, G, M, L. D. A, M, Y, D, H and G, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 352 to 622 of SEQ ID NO: 58, wherein one or more amino acid residues of the synthase that aiign with amino acid residues at positions 357, 360, 381, 384, 385, 463, 487, 488, 489, 490, 493, 528, 532, 606, 609, 610, 614, 616 and 617 of SEQ ID NO: 58 are residues other than amino acids Y, M, C, V, T, F, V, S, S, G, I, L, G, F, V, Y, D, Y and T, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to amino acid residues 272 to 540 encoded by SEQ ID NO: 33, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 277, 280, 301, 304, 305, 383, 408, 409, 410, 411, 414, 448, 452, 524, 527, 528, 532, 534 and 535 encoded by SEQ ID NOS: 33 are residues other than amino acids G, W, I, A, S, Y, T, S, G, Y, L, C, D, M, L, Y, D, Y and T, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 319 to 571 of SEQ ID NO: 42, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 324, 327, 348, 351, 352, 430, 455, 456, 457, 458, 461, 495, 499, 571, 574, 575, 579, 581 and 582 of SEQ ID NO: 42 are residues other than amino acids I, W, V, I, S, Y, T, T, G, L, V, I, N, T, S, Y, D, Y, and T, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 579 to 847 of SEQ ID NO: 44, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 584, 587, 606, 609, 610, 688, 713, 714, 715, 716, 719, 753, 757, 831, 834, 835, 839, 841 and 842 of SEQ ID NO: 44 are residues other than amino acids V, S, G, Q, V, Y, S, V, G, L, C, W, N, V, F, Y, D, Y and G, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 495 to 767 of SEQ ID NO: 46, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 500, 503, 524, 527, 528, 606, 631, 632, 633, 634, 637, 674, 678, 751, 754, 755, 759, 761 and 762 of SEQ ID NO: 46 are residues other than amino acids F, L, A, Q, T, Y, S, I, G, Q, L, S, D, T, I, F, D, F and G, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 295 to 564 of SEQ ID NO: 48, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 300, 303, 324, 327, 328, 406, 431, 432, 433, 434, 437, 471, 475, 548, 551, 552, 556, 558 and 559 of SEQ ID NO: 48 are residues other than amino acids Y, W, A, C, T, Y, S, S, G, M, L, G, D, L, I, Y, D, L and Y, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 307 to 578 of SEQ ID NO: 50, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 312, 315, 336, 339, 340, 419, 444, 445, 446, 447, 450, 484, 488, 562, 565, 566, 570, 572 and 573 of SEQ ID NO: 50 are residues other than amino acids F, W, A, M, T, Y, N, T, G, M, L, S, D, I, M, Y, D, F and S, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 264 to 533 of SEQ ID NO: 52, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 269, 272, 293, 296, 297, 375, 401, 402, 403, 404, 407, 441, 445, 517, 520, 521, 525, 527 and 528 of SEQ ID NO: 52 are residues other than amino acids C, W, L, T, S, Y, S, A, G, Y, I, A, N, A, L, Y, D, Y and S, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 585 to 853 of SEQ ID NO: 56, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 590, 593, 614, 617, 618, 696, 721, 722, 723, 724, 727, 761, 765, 837, 840, 841, 845, 847 and 848 of SEQ ID NO: 56 are residues other than amino acids I, S, S, T, V, Y, S, I, A, L, V, G, N, M, F, Y, D, L and T, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 307 to 574 of SEQ ID NO: 54, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 312, 315, 336, 339, 340, 418, 443, 444, 445, 446, 449, 483, 487, 560, 563, 564, 566, 568 and 569 of SEQ ID NO: 54 are residues other than amino acids C, W, I, I, T, Y, S, I, S, A, I, L, D, A, I, Y, D, D and G, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 309 to 577 of SEQ ID NO: 24, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 314, 317, 338, 341, 342, 420, 446, 447, 448, 449, 452, 485, 489, 560, 563, 564, 569, 571 and 572 of SEQ ID NO: 24 are residues other than amino acids C, W, N, V, T, Y, I, G, G, I, L, L, D, A, I, Y, D, F and G, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

10

15

30

35

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 315 to 584 of SEQ ID NO: 26, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 320, 323, 344, 347, 348, 426, 451, 452, 453, 454, 457, 492, 496, 568, 571, 572, 576, 578 and 579 of SEQ ID NO: 26 are residues other than amino acids S, W, I, A, T, Y, S, V, A, S, I, L, D, A, I, Y, D, F, and G, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 265 to 536 of SEQ ID NO: 28, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 270, 273, 294, 297, 298, 376, 401, 402, 403, 404, 407, 440, 444, 518, 521, 522, 528, 530 and 531 of SEQ ID NO: 28 are residues other than amino acids A, W, V, C, G, F, T, S, C, I, M, G, N, C, S, Y, D, Y and S, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 342 to 612 of SEQ ID NO: 30, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 347, 350, 371, 374, 375, 453, 478, 479, 480, 481, 483, 518, 522, 596, 599, 600, 604, 606 and 607 of SEQ ID NO: 30 are residues other than amino acids F, L, C, V, T, Y, S, S, A, Y, V, L, G, L, L, Y, D, F and S, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more of the ordered arrangements of residues as given in Table 7 are not found in such a synthase.

The invention also features an isolated synthase having a region with about 40% or greater sequence identity to residues 273 to 541 of SEQ ID NO: 32, wherein one or more amino acid residues of the synthase that align with amino acid residues at positions 278, 281, 302, 305, 306, 384, 409, 410, 411, 412, 415, 448, 452, 524, 527, 528, 533, 535 and 536 of SEQ ID NO: 32 are residues other than amino acids C, W, I, I, S, Y, T, S, T, Y, L, C, D, I, T, Y, D, Y and T, respectively. In some embodiments, the sequence identity can be about 20% or greater, 25% or greater, or 35% or greater. In some embodiments, one or more ordered arrangements of residues as given in Table 7 are not found in such a synthase.

35

The invention also features a method for making a terpene synthase, comprising identifying, in a preselected polypeptide having a region with 20% or greater sequence identity to residues 265 to 535 of SEQ ID NO: 2, nine amino acid residues whose α -carbons have interatomic distances in Angstroms between the α carbons that are ±2.3 Angstroms of the interatomic distances given in Table 6. The center point of each α-carbon is positioned within a sphere having a radius of 2.3 Angstroms. The center point of each sphere has the structural coordinates given in Table 5. The method then comprises synthesizing a polypeptide that is modified from the preselected polypeptide. The modified polypeptide has one or more Rgroups associated with the nine α -carbons other than the R-groups associated with the α -carbons in the preselected polypeptide. The synthesizing step can comprise the formation of a nucleic acid encoding the preselected polypeptide in which the coding sequence for one or more amino acids corresponding to the nine α -carbons is replaced by a coding sequence that codes for an amino acid different from the amino acid present in the preselected polypeptide. The preselected polypeptide can be, for example, any one of the polypeptides given in SEQ ID NOS: 2, 4, 6, 8, 10, 12, 20, 22, 24, 26, 28, 30, 32, 34-40, 42, 44, 46, 48, 50, 52, 54, 56, or 58.

The invention also features a method of using a terpene synthase. comprising identifying, in a preselected polypeptide having a region with 20% or greater sequence identity to residues 265 to 535 of SEQ ID NO: 2, amino acid residues at nine positions that align with amino acid residues 273, 294, 402, 403. 404, 407, 440, 519 and 520 of SEQ ID NO: 2; and synthesizing a polypeptide that is modified from the preselected polypeptide. The novel polypeptide is modified by having amino acid residues at one or more of the nine positions other than the amino acid residues present in the preselected polypeptide. In some embodiments, the identifying step can comprise identifying sixteen amino acid residues in the preselected polypeptide that align with amino acid residues 270, 273, 294, 297, 298, 402, 403, 404, 407, 440, 516, 519, 520, 525, 527 and 528 of SEQ ID NO: 2, and the synthesizing step can comprise synthesizing a polypeptide that is modified from the preselected polypeptide, the modified polypeptide having amino acid residues at one or more of the sixteen positions other than the amino acid residues present in the preselected polypeptide. In some embodiments, the identifying step can comprise identifying nineteen amino acid residues in the preselected polypeptide that align with amino acid residues 270, 273, 294, 297, 298, 376, 401, 402, 403, 404, 407, 440, 444, 516, 519, 520, 525, 527 and 528 of SEQ ID NO: 2, and the synthesizing step can comprise synthesizing a polypeptide that is modified from the preselected polypeptide, the modified polypeptide having amino acid residues at one or more of

10

15

20

25

30

35

the nineteen positions other than the amino acid residues present in the preselected polypeptide. The synthesizing step can comprise the formation of a nucleic acid encoding the preselected polypeptide in which the coding sequence in the nucleic acid coding for one or more of the identified amino acid residues is replaced by a coding sequence that encodes an amino acid different from the amino acid present in the preselected polypeptide. The preselected polypeptide can be, for example, any one of the polypeptides given in SEQ ID NOS: 2, 4, 6, 8, 10, 12, 20, 22, 24, 26, 28, 30, 32, 34-40, 42, 44, 46, 48, 50, 52, 54, 56, or 58. The method can further comprise: contacting the modified polypeptide with an isoprenoid substrate under conditions effective for the compound to bind the polypeptide; and measuring the ability of the modified polypeptide to catalyze the formation of a reaction product from the isoprenoid substrate. The isoprenoid substrate can be a monoterpene, a sesquiterpene, or a diterpene.

The invention also features a method of making a terpene synthase, comprising creating a population of nucleic acid molecules that encode polypeptides, the population having members that differ from one another at one or more of nine codons specifying amino acids of a preselected terpene synthase having a region with about 20% or greater sequence identity to residues 265 to 535 of SEQ ID NO: 2, α-carbons of the nine amino acids having interatomic distances in Angstroms between the α -carbons that are ± 2.3 Angstroms of the interatomic distances given in Table 6. The center point of each α -carbon is positioned within a sphere having a radius of 2.3 Angstroms, and the center point of each sphere has the structural coordinates given in Table 5. In some embodiments, the codons specify amino acids as described in Tables 1-2 or 3-4 of a preselected terpene synthase. A portion, or all, of the nucleic acid population is expressed so that a population of polypeptides is made. At least one member of the population of polypeptides is a mutant terpene synthase. The expressing step can comprise in vitro transcription and in vitro translation of the nucleic acid population. In some embodiments, the expressing step comprises cloning members of the nucleic acid population into an expression vector; introducing the expression vector into host cells and expressing the cloned nucleic acid population members in the host cells so that the population of polypeptides is made. The preselected terpene synthase polypeptide can be a monoterpene synthase, a sesquiterpene synthase, or a diterpene synthase. The host cells can be prokaryotic cells or eukaryotic cells, including, without limitation, bacterial cells, fungal cells, and animal cells, e.g., mammalian cells or insect cells. The host cells can also be plant cells, e.g., a cell from a Graminaceae plant, a cell from a

10

15

20

25

30

35

Legumineae plant, a cell from a Solanaceae plant, a cell from a Brassicaeae plant or a cell from a Conifereae plant.

The invention also features a nucleic acid encoding a synthase as described herein, and a host cell containing such a nucleic acid. The invention also features a transgenic plant containing such a nucleic acid, or a transgenic animal cell culture containing such a nucleic acid.

In some embodiments, a synthase polypeptide of the invention comprises a domain that contains an active site comprised of nine a-carbon atoms having the coordinates of Table 5, and interatomic distances between the α-carbons ± 2.3 angstroms of the distances given in Table 5. The α -carbon atoms align structurally in three dimensional space in the presence or absence of bound substrate or substrate analogue, with avian FPP synthase. In another embodiment, a synthase of this invention comprises the following: (i) a first domain containing amino acid residues that align in three-dimensional space (in solution or crystal form, and either having a bound or unbound substrate) with a glycosyl hydrolase catalytic core selected from the group consisting of (a) amino acids 36-230 of glycosyl hydrolase (PDB code 3GLY) of Aspergillus awarmori, and (b) amino acids 36-230 of endogluconase CellB (PDB code 1CLC), and (ii) a second domain that aligns structurally in three dimensional space with or without substrate or substrate analogues bound in the active site with avian FPP synthase. The second domain contains an active site comprised of nine, sixteen or nineteen a-carbon atoms having the structural coordinates and interatomic distances of Tables 1-2, 3-4 or 5-6. These α-carbon atoms have R-groups attached thereto that can interact, either directly or indirectly, with an isoprenoid substrate.

The invention also features a method for generating mutant terpene synthases possessing catalytic activity. The method comprises the steps of (a) providing a crystallographic model of a preselected catalytically active terpene synthase having an active site, and (b) using the model to design a terpene synthase having at least one altered R-group in the active site relative to the preselected synthase. The invention also features terpene synthases having altered substrate specificity, methods of making the same, and procedures for generating three-dimensional structures thereof.

Although methods and materials similar or equivalent to those described herein can be used to practice the invention, suitable methods and materials are described below. All publications, patent applications, patents and other references mentioned herein are incorporated by reference in their entirety.

Brief Description of the Sequence Listing

SEQ ID NO:1 is the DNA coding sequence for a tobacco 5-epiaristolochene synthase (TEAS) protein. Genbank No: Q40577.

SEQ ID NO:2 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:1.

SEQ ID NO:3 is the DNA coding sequence for a TEAS protein in which the codon for Trp273 has been changed to a codon for Glu.

SEQ ID NO:4 is the amino acid sequence for the W273E protein encoded by the TEAS DNA of SEQ ID NO:3.

SEQ ID NO:5 is the DNA coding sequence for a TEAS protein in which the codon for Tyr520 has been changed to a codon for Phe.

SEQ ID NO:6 is the amino acid sequence for the Y520F protein encoded by the TEAS DNA of SEQ ID NO:5.

SEQ ID NO:7 is the DNA coding sequence for a TEAS protein in which the codon for Tyr527 has been changed to a codon for Phe.

SEQ ID NO:8 is the amino acid sequence for the Y527F protein encoded by the TEAS DNA of SEQ ID NO:7.

SEQ ID NO:9 is the DNA coding sequence for a TEAS protein in which the codon for Trp273 has been changed to a codon for Ser and the codon for Cys440 has been changed to a codon for Trp.

30

5

SEQ ID NO:10 is the amino acid sequence for the W273S/C440W protein encoded by the TEAS DNA of SEQ ID NO:9.

SEQ ID NO:11 is the DNA coding sequence for TEAS proteins in which the codons for Tyr406 and Leu407 have each been changed to the nucleotides NNS.

SEQ ID NO:12 is the amino acid sequence for the population of Y406X/L407X proteins encoded by the TEAS DNA of SEQ ID NO:11, where X is any naturally occurring amino acid.

SEQ ID NO:13 is a DNA primer sequence.

SEQ ID NO:14 is a DNA primer sequence.

SEQ ID NO:15 is a DNA primer sequence.

SEQ ID NO:16 is a DNA primer sequence.

SEQ ID NO:17 is a DNA primer sequence.

SEQ ID NO:18 is a DNA primer sequence.

SEQ ID NO:19 is the DNA coding sequence for a grand fir pinene synthase. Genbank Accession No: U87909.

SEQ ID NO:20 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:19.

SEQ ID NO:21 is the DNA coding sequence for a spearmint limonene synthase. Genbank Accession No: L13459.

SEQ ID NO:22 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:21.

SEQ ID NO:23 is the DNA coding sequence for a sage 1, 8 cineole synthase. Genbank Accession No: AF051899.

SEQ ID NO:24 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:23.

SEQ ID NO:25 is the DNA coding sequence for a sage bornyl diphosphate synthase. Genbank Accession No: AF051900.

SEQ ID NO:26 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:25.

SEQ ID NO:27 is the DNA coding sequence for a mint E-b-farnesene synthase. Genbank Accession No: AF024615.

SEQ ID NO:28 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:27.

35 SEQ ID NO:29 is the DNA coding sequence for a grand fir myrcene synthase. Genbank Accession No: U87908.

10

30

SEQ ID NO:30 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:29.

SEQ ID NO:31 is the DNA coding sequence for a potato vetaspiradiene synthase. Genbank Accession No: AB022598.

SEQ ID NO:32 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:31.

SEQ ID NO:33 is the genomic DNA coding sequence for a cotton delta-cadinene synthase. Genbank Accession No: Y18484.

SEQ ID NOS:34-40 are the amino acid sequences for the exons encoded by the DNA of SEQ ID NO:33.

SEQ ID NO:41 is the DNA coding sequence for a castor bean casbene synthase. Genbank Accession No: L32134.

SEQ ID NO:42 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:41.

SEQ ID NO:43 is the DNA coding sequence for a yew taxadiene synthase. Genbank Accession No: U48796.

SEQ ID NO:44 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:43.

SEQ ID NO:45 is the DNA coding sequence for a grand fir E-alpha-20 bisabolene synthase. Genbank Accession No: AF006194.

SEQ ID NO:46 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:45.

SEQ ID NO:47 is the DNA coding sequence for a grand fir deltaselinene synthase. Genbank Accession No: U92266.

SEQ ID NO:48 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:47.

SEQ ID NO:49 is the DNA coding sequence for a grand fir gamma-humulene synthase. Genbank Accession No: U92267.

SEQ ID NO:50 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:49.

SEQ ID NO:51 is the DNA coding sequence for a tomato germacrene C synthase. Genbank Accession No: AF035631.

SEQ ID NO:52 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:51.

35 SEQ ID NO:53 is the DNA coding sequence for a sage +sabinene synthase. Genbank Accession No: AF051901.

10

15

20

25

30

35

SEQ ID NO:54 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:53.

SEQ ID NO:55 is the DNA coding sequence for a grand fir abietadiene synthase. Genbank Accession No: U50768.

SEQ ID NO:56 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:55.

SEQ ID NO:57 is the DNA coding sequence for a grand fir limonene synthase. Genbank Accession No: AF006193.

SEQ ID NO:58 is the amino acid sequence for the protein encoded by the DNA of SEQ ID NO:57.

Detailed Description

The following terms are used herein:

" α -carbon" refers to the chiral carbon atom found in an amino acid residue. Four substituents are covalently bound to the α -carbon, including an amino group, a carboxyl group, a hydrogen atom, and an R-group.

"R-group" refers to a substituent attached to the α -carbon of an amino acid residue that is not involved in peptide bond formation in a protein. An R-group is an important determinant of the overall chemical character of an amino acid. The twenty naturally occurring amino acids found in proteins and the R-groups associated with the α -carbon of each amino acid are listed in Figure 2. The three-letter and one-letter abbreviations for naturally occurring amino acids are sometimes used herein to refer to the R-group associated with a particular amino acid.

"Naturally occurring amino acid" includes L-isomers of the twenty amino acids naturally occurring in proteins. Naturally occurring amino acids are glycine, alanine, valine, leucine, isoleucine, serine, methionine, threonine, phenylalanine, tyrosine, tryptophan, cysteine, proline, histidine, aspartic acid, asparagine, glutamic acid, glutamine, arginine, and lysine. Unless specially indicated, all amino acids referred to in this application are in the L-form. Three-letter and one-letter abbreviations are sometimes used herein to refer to naturally occurring amino acids. These abbreviations are known in the art.

"Unnatural amino acid" includes amino acids that are not naturally found in proteins. Examples of unnatural amino acids included herein are racemic mixtures of selenocysteine and selenomethionine. In addition, unnatural amino acids include the D or L forms of norleucine, para-nitrophenylalanine, homophenylalanine,

10

15

20

25

30

35

para-fluorophenylalanine, 3-amino-2-benzylpropionic acid, homoarginine, D-phenylalanine, and the like.

"Positively charged amino acid" includes any naturally occurring or unnatural amino acid having an R-group that carries a positive charge under normal physiological conditions. Examples of positively charged, naturally occurring amino acids include arginine and lysine.

"Negatively charged amino acid" includes any naturally occurring or unnatural amino acid having an R-group that carries a negative charge under normal physiological conditions. Examples of negatively charged, naturally occurring amino acids include aspartic acid and glutamic acid.

"Hydrophobic amino acid" includes any naturally occurring or unnatural amino acid having an uncharged, nonpolar side chain under normal physiological conditions. Examples of naturally occurring hydrophobic amino acids are leucine, isoleucine, valine and methionine.

"Hydrophilic amino acid" includes any naturally occurring or unnatural amino acid having a charged polar side chain. Examples of naturally occurring hydrophilic amino acids include serine, threonine and cysteine.

"Mutant terpene synthase" or "mutated terpene synthase" refers to a synthase polypeptide having a primary amino acid sequence. The center point of the α -carbon of nine residues of the polypeptide is positioned within a sphere having a radius of 2.3 Angstroms; the center points of the nine spheres have the structural coordinates of Table 5 or coordinates which can be rotated and/or translated to coincide with the coordinates of Table 5. The relative interatomic distances between the nine α -carbons is ± 2.3 angstroms of the interatomic distances given in Table 6. Each α -carbon has an associated R-group. A mutant synthase differs from a non-mutant synthase in the ordered arrangement of R-groups associated with the nine α -carbons. A mutant synthase has an ordered arrangement of R-groups on the nine α -carbons other than the ordered arrangements of R-groups listed in Table 9. R-groups associated with other α -carbons of the synthase primary amino acid sequence may or may not be the same as in a non-mutated synthase.

In some embodiments, a mutant synthase refers to a synthase in which the center point of the α -carbon of sixteen residues of the polypeptide is positioned within a sphere having a radius of 2.3 Angstroms; the center points of the sixteen spheres have the structural coordinates of Table 3 or coordinates which can be rotated and/or translated to coincide with the coordinates of Table 3. The relative interatomic distances between the nine α -carbons is ± 2.3 angstroms of the interatomic distances given in Table 4. Each α -carbon has an associated R-group.

10

15

20

25

30

35

A mutant synthase differs from a non-mutant synthase in the ordered arrangement of R-groups associated with the sixteen α -carbons. A mutant synthase has an ordered arrangement of R-groups on the sixteen α -carbons other than the ordered arrangements of R-groups listed in Table 8. R-groups associated with other α -carbons of the synthase primary amino acid sequence may or may not be the same as in a non-mutated synthase.

In some embodiments, a mutant synthase refers to a synthase in which the center point of the α -carbon of nineteen residues of the polypeptide is positioned within a sphere having a radius of 2.3 Angstroms; the center points of the nineteen spheres have the three dimensional coordinates of Table 1 or coordinates which can be rotated and/or translated to coincide with the coordinates of Table 1. The relative interatomic distances between the nineteen α -carbons is ± 2.3 angstroms of the interatomic distances given in Table 2. Each α -carbon has an associated R-group. A mutant synthase differs from a non-mutant synthase in the ordered arrangement of R-groups associated with the nineteen α -carbons. A mutant synthase has an ordered arrangement of R-groups on the nineteen α -carbons other than the ordered arrangements of R-groups listed in Table 7. R-groups associated with other α -carbons of the synthase primary amino acid sequence may or may not be the same as in a non-mutated synthase.

"Nonmutated synthase" or "non-mutant synthase" includes a synthase having a primary amino acid sequence comprising nine, sixteen, or nineteen amino acid residues. The center point of each α -carbon of these residues is positioned within a sphere having a radius of 2.3 Angstroms; the center points of the spheres have the three dimensional coordinates of Tables 5, 3, or 1, respectively, or coordinates which can be rotated and/or translated to coincide with the coordinates of Tables 5, 3, or 1. The relative interatomic distances between the nine, sixteen, or nineteen α -carbons is ± 2.3 angstroms of the interatomic distances given in Tables 6, 4, or 2, respectively. Each α -carbon has an associated R-group. A non-mutant synthase has an ordered arrangement of R-groups on the nine, sixteen, or nineteen α -carbons as listed in Tables 9, 8, or 7, respectively.

"Degenerate variations thereof" refers to variants of a gene coding sequence by which the same polypeptide is encoded by different nucleotide sequences, due to the degeneracy of the genetic code. For example, synthases of the present invention have a primary amino acid sequence. Degenerate synthase variations are different nucleic acid coding sequences that nevertheless encode the same primary amino acid sequence due to the degeneracy of the genetic code.

10

15

20

25

30

35

"Expression" refers to transcription of a gene or nucleic acid molecule and the translation of that nucleic acid into a polypeptide. Expression of genes also involves processing of RNA into mRNA in eukaryotic systems. It is not necessary for the genes to integrate into the genome of a cell in order to achieve expression. This definition is not limited to expression in a particular system or a particular cell type and includes, without limitation, stable, transient, in vitro, and in vivo expression.

"Promoter" and "promoter regulatory element", refers to a nucleic acid that is involved in controlling expression of a gene. Promoter regulatory elements, and the like, from a variety of sources can be used efficiently to promote gene expression. Promoter regulatory elements include constitutive, tissue-specific, developmental-specific, inducible, subgenomic promoters, and the like. Promoter regulatory elements may also include certain enhancer elements or silencing elements that improve or regulate transcriptional efficiency.

"Active Site" refers to a site in a terpene synthase that binds the hydrophobic portion of a terpene substrate, GPP, FPP, and/or GGPP. The active site can, under certain conditions, catalyze a biosynthetic reaction that allows one or more reaction products to be produced.

"Altered enzymatic specificity" includes an alteration in the ability of a mutant synthase to use a particular terpene substrate or a change in the profile of reaction product(s) from a mutant synthase, compared to the substrate specificity of and the reaction products made by a corresponding non-mutated synthase. Altered specificity may include the ability of a synthase to exhibit different enzymatic parameters relative to a non-mutated synthase (Km, Vmax, etc), and/or to produce products that are different from those that are produced by a corresponding non-mutant synthase.

"Structure coordinates" or "structural coordinates" refers to Cartesian coordinates (x, y, and z positions) derived from mathematical equations involving Fourier synthesis as determined from patterns obtained via diffraction of a monochromatic beam of X-rays by the atoms (scattering centers) of a synthase molecule in crystal form. Diffraction data are used to calculate electron density maps of repeating protein units in the crystal (unit cell). Electron density maps are used to establish the positions of individual atoms within a crystal's unit cell. The absolute values for structural coordinates listed herein convey relative spatial relationships between atoms because the absolute values ascribed to structural coordinates can be changed by rotational and/or translational movement along the x, y and/or z axes, together or separately, while maintaining the same relative spatial relationships among atoms. Thus, a terpene synthase whose absolute values for a set of

structural coordinates can be rotationally or translationally adjusted to coincide with the particular values listed in Tables 1, 3, or 5 is considered to have the same structural coordinates as those of Tables 1, 3 or 5. An example of structural coordinates that coincide with the absolute values listed herein after rotation and/or translation are the coordinates of Table 11.

"Heavy atom derivatization" refers to a method of producing a chernically modified form of a synthase crystal. In practice, a crystal is soaked in a solution containing heavy atom salts or organometallic compounds, e. g., lead chloride, gold thiomalate, thimerosal, uranyl acetate and the like, which can diffuse through the crystal and bind to the protein's surface. Locations of the bound heavy atoms can be determined by X-ray diffraction analysis of the soaked crystal. The information is then used to construct phase information which can then be used to construct three-dimensional structures of the enzyme as described in Blundel, T. L., and Johnson, N. L., Protein Crystallography, Academic Press (1976).

15

10

5

"Unit cell" refers to a basic parallelepiped shaped block. Regular assembly of such blocks may construct the entire volume of a crystal. Each unit cell comprises a complete representation of the unit pattern, the repetition of which builds up the crystal.

20

"Mutagenesis" refers to the substitution of a different amino acid residue at a particular position in the primary amino acid sequence of a protein, thereby changing the R-group present at that position. Mutagenesis can be most easily performed by changing the coding sequence of a nucleic acid encoding the protein so that the coding sequence in the nucleic acid specifies an amino acid residue different from the residue initially present at that position.

25

30

35

"Space Group" refers to the arrangement of symmetry elements within a crystal.

"Molecular replacement" refers to the generation of a preliminary model of a synthase whose structural coordinates are unknown, by orienting and positioning a molecule whose structural coordinates are known within the unit cell of the unknown crystal so as best to account for the observed diffraction pattern of the unknown crystal. Phases can then be calculated from this model and combined with the observed amplitudes to give an approximate Fourier synthesis of the structure whose coordinates are unknown. This in turn can be subject to any of the several forms of refinement to provide a final, accurate structure of the unknown crystal (Lattman, E., 1985, in Methods in Enzymology, 115:55-77; Rossmann, MG., ed., "The Molecular Replacement Method" 1972, Int. Sci. Rev. Ser., No. 13, Gordon & Breach, New York). Using structure coordinates and interatomic distance matrices,

10

15

20

25

30

35

molecular replacement may be used to determine the structural coordinates of a crystalline mutant, homologue, or a different crystal form of terpene synthase.

"Recombinant protein" includes a protein that is chemically synthesized or derived biosynthetically from an isolated gene.

"Gene" includes naturally derived or genetically manipulated nucleic acids that contain the information needed to produce a polypeptide.

"Nucleic acid" includes any genetic material comprised of the nucleotides guanine, adenine, thymine, cytosine, uracil, inosine and the like. Nucleic acids may be single-, double-, or triple stranded. Nucleic acids may be deoxyribonucleic acid or ribonucleic acid.

"Genetically manipulated" includes genes that have been modified to contain a different nucleotide sequence from that present in a preselected nulceic acid. Genes can be manipulated by synthetically or via traditional cloning, PCR, chemical gene synthesis, direct or random mutagenesis, and gene shuffling. Genetically manipulated also includes the process of making genes that are degenerate variations of nucleic acids encoding preselected proteins.

"First domain" includes polypeptides having a first and second end wherein the first end can have an amino terminal amino acid with a free amino group and can be linked by a peptide bond to a second amino acid. The first end may also be modified through acetylation and the like. The second end of the first domain may or may not have a free carboxyl terminal group.

"Second domain" includes polypeptides having a first and second end wherein the first end can have an amino terminal amino acid and can be linked by a peptide bond to a second amino acid. The second end of the second domain may or may not have a carboxyl terminal group. Typically, the first end of the second domain is linked to the second end of the first domain via a peptide bond.

"Isoprenoid substrate" refers to the C₁₀, C₁₅, and C₂₀ molecules, named geranyl diphosphate (GPP), farnesyl diphosphate (FPP), and geranyl diphosphate (GGPP), respectively.

"Sequence identity" or "percent sequence identity" refers to the percentage of amino acids or nucleotides that occupy the same relative position when two protein sequences or nucleic acid sequences, a query sequence and a subject sequence, are aligned. The number of amino acid or nucleotide residues that are identical between both the subject and query sequences are counted, divided by the number of residues in the query sequence, and multiplied by 100. The process is repeated until the alignment resulting in the highest percent sequence identity is found. Percent sequence identity can be determined by visual inspection and/or by

10

35

using various computer programs, e.g., MegAlign (DNASTAR, Inc., Madison, Wisconsin) or BLAST programs available on the world wide web from the National Center for Biotechnology Information (NCBI). Gaps of one or more residues may sometimes be inserted to maximize sequence alignments to structurally conserved domains of the query sequence, i.e., α -helices, β -sheets and loops.

"Monoterpene product" refers to linear, cyclized, and/or hydroxylated reaction products made from the substrate GPP. "Sesquiterpene product" refers to linear, cyclized, and/or hydroxylated reaction products made from the substrate FPP. "Diterpene product" refers to linear, cyclized, and/or hydroxylated reaction products made from the substrate GGPP.

The present invention relates to terpene synthases and mutants thereof from which the position of specific α -carbon atoms and R-groups associated therewith comprising the active site can be determined in three-dimensional space. The invention also relates to structural coordinates of the synthases, use of the structural coordinates to develop structural information related to synthase homologues, mutants, and the like, and to crystal forms of such synthases. Furthermore, the invention provides a method whereby α -carbon structural coordinates for atoms comprising the active site of a preselected terpene synthase can be used to develop synthases in which R-groups associated with active site α -carbon atoms are different from the R-groups found in the preselected terpene synthase. In addition, the present invention provides for the production of novel terpene synthases based on the structural information provided herein and for the use of such synthases to make a variety of isoprenoid compounds.

The present invention further provides, for the first time, crystals of a synthase, as exemplified by tobacco 5-epi-aristolochene synthase (TEAS), which are grown in the presence or absence of substrate and substrate analogues, thus allowing definition of the structural coordinates associated therewith. The structural coordinates allow determination of the α -carbon atoms comprising the active site and R-groups associated therewith. The crystals of the present invention belong to the tetragonal space group P4₁2₁2; the unit cell dimensions vary by a few angstroms between crystals but on average a = 126 angstroms, c = 122 angstroms, a=b, α = 90°, β = 90°, and γ = 90°.

Structural coordinates are preferably obtained at a resolution of about 2.2 to about 2.8 angstroms for a synthase in the presence and in the absence of bound substrate or substrate analog. Coordinates for a synthase with a substrate analog bound in the active site are given in Table 10. Coordinates for a synthase in

10

15

20

25

30

35

the absence of a substrate analog bound in the active site are given in Table 11. Those skilled in the art understand that a set of structure coordinates determined by X-ray crystallography is not without standard error. Therefore, for the purpose of this invention, any set of structure coordinates wherein the active site α -carbons of a synthase, synthase homologue, or mutants thereof, have a root mean square deviation less than ± 2.3 angstroms when superimposed using the structural coordinates listed in Table 1, 3, or 5, are considered identical.

A schematic representation of the three-dimensional shape of a synthase is shown in Figure 1 which was prepared by RIBBONS (Carson and Bugg, 1986, J. Mol. Graphics, 4:121). The synthase shown in Figure 1 consists entirely of α -helices and short connecting loops and turns, organized into first and second structural domains.

In one embodiment, an isolated synthase of the invention comprises sixteen active site α -carbons having the structural coordinates of Table 3 and the relative distances ± 2.3 angstroms of the distances given in Table 4. The active site α -carbons of Table 3 generally are not all contiguous, i.e., are not adjacent to one another in the primary amino acid sequence of a synthase, due to intervening amino acid residues between various active site α -carbons. On the other hand, it should be appreciated that some of the active site α -carbons can be adjacent to one another in some instances. In the embodiment depicted in the TEAS Y527F protein (SEQ ID NO:8), for example, active site α -carbons are adjacent to one another in the primary amino acid sequence at positions 402, 403 and 404, respectively, whereas active site α -carbons at residues 273 and 294 are separated and thus are not adjacent. Thus, the numbering of active site α -carbons given in Tables 1, 2, 3, 4, 5, or 6 is merely for convenience and such α -carbons may reside at any position in the primary amino acid sequence that achieves the structural coordinates given in Tables 1, 3, or 5 and the relative interatomic distances ± 2.3 angstroms given in Tables 2, 4, or 6.

An appropriate combination of R-groups, linked to active site α -carbons, can facilitate the formation of one or more desired reaction products. The combination of R-groups selected for use in a terpene synthase of the invention can be any combination other than the ordered arrangements of R-groups and corresponding active site α -carbons shown in Tables 7, 8, or 9. An illustrative example of a suitable arrangement of R-groups and α -carbons is Cys, Trp, Ile, Ile, Ser, Thr, Tyr, Leu, Cys, Val, Thr, Phe, Asp, Tyr and Thr, associated with active site α -carbons 1 to 16, respectively, of Table 3. Another example of a suitable arrangement of R-groups and α -carbons is Cys, Trp, Ile, Ile, Ser, Thr, Thr, Tyr, Leu,

Cys, Val, Thr, Tyr, Asp, Phe, and Thr at active site alpha-carbons 1 to 16, respectively, of Table 3. In some embodiments, a synthase of the invention may have primary amino acid sequences as listed in SEQ ID NO:4, SEQ ID NO:6, SEQ ID NO:8, and SEQ ID NO:10, DNA molecules encoding the same, which are listed in SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7, and SEQ ID NO:9, respectively, and degenerate variations thereof. Typically, R-groups found on active site α-carbons are those found in naturally occurring amino acids. See, e.g., Figure 2. In some embodiments, however, R-groups other than naturally occurring amino acids can be used.

Some arrangements of R-groups and active site α -carbons result in mutant terpene synthases that form reaction products. Such enzymatically active synthases and their corresponding genes are useful to make known terpenoid hydrocarbons, e.g., monoterpenes such as pinene, sesquiterpenes such as delta-cadinene and diterpenes such as abietadiene. Other enzymatically active synthases can be used to make novel terpenoid products.

Some arrangements of R-groups and active site α -carbons may result in mutant terpene synthases that do not form reaction product(s) at a desired rate. Such synthases and their genes are useful as controls in analyses of product formation by enzymatically active mutant synthases. Such synthases and their genes can also be useful in analyses of translation of enzymatically active mutant synthase genes, or as nutritional supplements. Such synthases can be attached to Sepharose beads and used for affinity purification of isoprenoid compounds from crude preparations. In addition, such synthases and their genes can also be useful to develop reagents for various purposes, e.g., immunological reagents to monitor expression of a terpene synthase protein or nucleic acid probes or primers to monitor inheritance of a terpene synthase gene in a plant breeding program.

In some embodiments, the α -carbon backbone of a synthase first domain aligns structurally with the catalytic core of glycosyl hydrolases, as exemplified by glucoamylase (Brookhaven Protein Database (PDB) code 3GLY) from Aspergillus awamori (Aleshin et al., 1994, J. Mol. Biol., 238:575) and endoglucanase CeID (PDB code ICLC) from Clostridium thermocelum (Juy et al., 1992, Nature, 357:89), and the α -carbon backbone of a synthase second domain, which contains the active site, aligns structurally with avian famesyl diphosphate synthase (FPS), wherein the active site is comprised of 9, 16, or 19 amino acid residues with α -carbon structural coordinates as listed in Tables 1, 3, or 5 and interatomic distances as

described in Tables 2, 4, or 6. Such α -carbons have an ordered arrangement of R-groups different from that observed in a non-mutated synthase.

In the present invention, the first domain forms a twisted α-barrel made up of eight short (10 to 15 amino acid residues) helices surrounding a surface cavity filled by ordered water molecules when hydrated. The second domain comprises a two-layered barrel of α-helices surrounding a hydrophobic and aromatic-rich active site pocket. Typically, the second domain contains a substrate binding site. As exemplified in Figure 1, helix H is disrupted between segments H1 and H2 by an amino acid such as proline, but its interhelical packing with helix G is accommodated by a corresponding kink in helix G between G1 and G2. Within this kink, hydrogen bonds between a hydroxyl group, such as that found on a threonine, and the carbonyl oxygen of other amino acids disrupt the main chain intrahelical hydrogen bonding of helix G thus assisting in producing the structure as determined.

As exemplified by TEAS, terpene synthases of the present invention can have a first domain segment comprising helices A, B, and C (an A-C loop), and a second domain comprising helices J and K (a J-K loop) (Figure 1). The ordering of these loops upon substrate binding results in a closed, solvent-inaccessible active site pocket. As the J-K loop becomes ordered, a lid-type structure is formed that clamps down over the active site entrance in the presence of substrate and an extended aromatic patch deep within the active site pocket is formed. As the A-C loop becomes ordered, it translates inward toward the active site, positioning certain R groups in this loop at or near the active site. Thus, substrate binding to the active site results in a change in protein conformation.

To identify or create mutant terpene synthases, sequence alignments can be performed to locate specific residues and α -carbons in a preselected polypeptide that have the structural coordinates and interatomic distances of Tables 1-2, 3-4 or 5-6. The preselected polypeptide is used as the subject sequence in the alignment, e.g., the full-length primary amino acid sequence, a region 190 residues in length, a region 220 residues in length, or a region 300 residues in length. The alignment can use residues 265 to 535 of TEAS (SEQ ID NO: 2), which includes the α -carbons of Tables 1, 3 or 5, as the query sequence to align with the preselected polypeptide. The preselected polypeptide and the query sequence can be aligned using the BLASTp 2.0.9 computer program with a BLOSUM 62 scoring matrix, an expect value of 10, a gap open value of 11, an x_dropoff value of 50, a gap extension value of 1, a wordsize of 3 and no filtering of low complexity sequences. As an alternative, the BLASTp 2.0.9 program can be used with a BLOSUM 50 scoring matrix, an expect value of 10, a gap open value 13, an x_dropoff value of 50, a gap

10

15

20

25

30

35

extension value of 2, a wordsize of 3 and no filtering of low complexity sequences. Other parameter values can also be used, e.g., a gap extension value from 0 to 4. See Altschul, et al., Nucl. Acids Res. 25:3389-3402.

Regions of the preselected polypeptide with significant sequence identity to residues 265-535 of TEAS, e.g., 20% or greater sequence identity, 25% or greater sequence identity, 35% or greater sequence identity, 40% or greater sequence identity, 50% or greater sequence identity, 60% or greater sequence identity, 70% or greater sequence identity, or 80% or greater sequence identity are examined for specific residues that align with the TEAS residues corresponding to those listed in Tables 1, 3, or 5. In some cases, the output of the computer program alignment identifies a specific residue in the preselected polypeptide for each of the nine, sixteen, or nineteen residues in the query sequence having the structural coordinates and interatomic distances of Tables 1-2, 3-4 or 5-6, with or without gaps introduced by the alignment program. In other cases, a gap is introduced by the alignment program in either the query sequence or the subject sequence such that no direct alignment or a misalignment occurs between one or more of the nine, sixteen, or nineteen residues in the query sequence that are of interest. In either case, the output can be visually inspected, and specific residues can be chosen in the subject sequence after adjusting the alignment so that alpha-helices and betasheet regions in the query sequence are maintained and that gaps or insertions in the subject sequence align with loop regions of the query sentence.

Sequence alignments suggest that other terpene synthases have regions with 20% or greater sequence identity to residues 265-535 of TEAS. Therefore, a region of a terpene synthase other than TEAS can be used as the query sequence, e.g., regions of terpene synthases given in SEQ ID NOS: 4, 6, 8, 10, 12, 20, 22, 24, 26, 28, 30, 32, 34-40, 42, 44, 46, 48, 50, 52, 54, 56, or 58, that have significant sequence identity to residues 265-535 of SEQ ID NO: 2. For example, large sequence insertions are present at the amino terminus in taxadiene synthase (SEQ ID NO: 44) with respect to TEAS, or are within solvent-exposed loops in the amino-terminal domain. Thus, regions of taxadiene synthase with greater than 20% sequence identity to SEQ ID NO: 2 are closer to the carboxy-terminal end, e.g., from residue 579 to residue 847 of SEQ ID NO: 44.

Useful regions of other terpene synthases that can be used as the query sequence include, without limitation, residues 343 to 606 of SEQ ID NO: 20, 316 to 586 of SEQ ID NO: 22, residues 352 to 622 of SEQ ID NO: 58, residues 272 to 540 encoded by SEQ ID NO: 33, residues 319 to 571 of SEQ ID NO: 42, residues 579 to 847 of SEQ ID NO: 44, residues 495 to 767 of SEQ ID NO: 46, residues 295

10

15

20

25

30

35

to 564 of SEQ ID NO: 48, residues 307 to 578 of SEQ ID NO: 50, residues 264 to 533 of SEQ ID NO: 52, residues 585 to 853 of SEQ ID NO: 56, residues 307 to 574 of SEQ ID NO: 54, residues 309 to 577 of SEQ ID NO: 24, residues 315 to 584 of SEQ ID NO: 26, residues 265 to 536 of SEQ ID NO: 28, residues 342 to 612 of SEQ ID NO: 30 and residues 273 to 541 of SEQ ID NO: 32.

One or more of the specific residues in the subject sequence that align with residues in the query sequence are mutated in the preselected polypeptide, e.g, by making mutations in a nucleic acid encoding the polypeptide. The mutant terpene synthase thus created can then be expressed in a host cell and the protein evaluated for enzymatic activity, if desired.

Mutant proteins of the present invention may be prepared in a number of ways including but not limited to oligonucleotide-directed mutagenesis, deletion, chemical mutagenesis, and the like. One or more R-groups associated with the active site α -carbon atoms in a terpene synthase are changed by altering the nucleotide sequence of the corresponding gene. For example, a mutation can be introduced into SEQ ID NO:1, the nucleotide sequence for TEAS, at codons encoding one or more of the following sixteen α-carbons: α-carbon 1 = Cys 270; αcarbon 2 = Trp 273; α -carbon 3 = Ile 294; α -carbon 4 = Ile 297; α -carbon 5 = Ser298; α -carbon 6 = Thr 402; α -carbon 7 = Thr 403; α -carbon 8 = Tyr 404; α -carbon 9 = Leu 407; α -carbon 10 = Cys 440; α -carbon 11 = Val 516; α -carbon 12 = Thr 519; α -carbon 13 = Tyr 520; α -carbon 14 = Asp 525; α -carbon 15 = Tyr 527; or α -carbon 16 = Thr 528. The protein encoded by the mutant gene is then produced by expressing the gene in, for example, a bacterial or plant expression system. Alternatively, synthase mutants may be generated by site specific replacement of a particular amino acid with an unnaturally occurring amino acid. As such, synthase mutants may be generated through replacement of an amino acid residue or a particular cysteine or methionine residue with selenocysteine or selenomethionine. This may be achieved by growing a host organism capable of expressing either the wild-type or mutant polypeptide on a growth medium depleted of natural cysteine or methionine or both and growing on medium enriched with either selenocysteine, selenomethionine, or both. These and similar techniques are described in Sambrook et al., (Molecular Cloning, A Laboratory Manual, 2rd Ed. (1989) Cold Spring Harbor Laboratory Press).

Another suitable method of creating mutant synthases of the present invention is based on a procedure described in Noel and Tsal (1989) J. Cell. Biochem., 40:309-320. In so doing, the nucleic acid encoding the synthase can be synthetically produced using oligonucleotides having overlapping regions, the oligonucleotides being degenerate at specific bases so that mutations are induced.

10

15

20

25

30

35

According to the present invention, nucleic acid sequences encoding a mutated synthase can be produced by the methods described herein, or any alternative methods available to the skilled artisan. In designing the nucleic acid sequence (gene) of interest, it may be desirable to reengineer the gene for improved expression in a particular expression system. For example, it has been shown that many bacterially derived genes do not express well in plant systems. In some cases, plant-derived genes do not express well in bacteria. This phenomenon may be due to the non-optimal G+C content or A+T content of the gene relative to the expression system being used. For example, the very low G+C content of many bacterial genes results in the generation of sequences mimicking or duplicating plant gene control sequences that are highly A+T rich. The presence of A+T rich sequences within the genes introduced into plants (e.g., TATA box regions normally found in gene promoters) may result in aberrant transcription of the gene(s). In addition, the presence of other regulatory sequences residing in the transcribed mRNA (e.g. polyadenylation signal sequences (AAUAAA) or sequences complementary to small nuclear RNAs involved in pre-mRNA splicing) may lead to RNA instability. Therefore, one goal in the design of genes is to generate nucleic acid sequences that have a G+C content that affords mRNA stability and translation accuracy for a particular expression system.

Due to the plasticity afforded by the redundancy of the genetic code (i.e., some amino acids are specified by more than one codon), evolution of the genomes of different organisms or classes of organisms has resulted in differential usage of redundant codons. This "codon bias" is reflected in the mean base composition of protein coding regions. For example, organisms with relatively low G+C contents utilize codons having A or T in the third position of redundant codons, whereas those having higher G+C contents utilize codons having G or C in the third position. Therefore, in reengineering genes for expression, one may wish to determine the codon bias of the organism in which the gene is to be expressed. Looking at the usage of the codons as determined for genes of a particular organism deposited in GenBank can provide this information. After determining the bias thereof, the new gene sequence can be analyzed for restriction enzyme sites as well as other sites that could affect transcription such as exon:intron junctions, polyA addition signals, or RNA polymerase termination signals.

Genes encoding synthases can be placed in an appropriate vector, depending on the artisan's interest, and can be expressed using a suitable expression system. An expression vector, as is well known in the art, typically includes elements that permit replication of said vector within the host cell and may

10

15

20

25

30

35

contain one or more phenotypic markers for selection of cells containing said gene. The expression vector will typically contain sequences that control expression such as promoter sequences, ribosome binding sites, and translational initiation and termination sequences. Expression vectors may also contain elements such as subgenomic promoters, a repressor gene or various activator genes. The artisan may also choose to include nucleic acid sequences that result in secretion of the gene product, movement of said product to a particular organelle such as a plant plastid (see U.S. Patent Nos. 4,762,785; 5,451,513 and 5,545,817), or other sequences that increase the ease of peptide purification, such as an affinity tag.

A wide variety of expression control sequences are useful in expressing mutated synthases when operably linked thereto. Such expression control sequences include, for example, the early and late promoters of SV40 for animal cells, the lac system, the trp system, major operator and promoter systems of phage λ , and the control regions of coat proteins, particularly those from RNA viruses in plants. In E. coli, a useful transcriptional control sequence is the T7 RNA polymerase binding promoter, which can be incorporated into a pET vector as described by Studier et al., (1990) Methods Enzymology, 185:60-89.

For expression, a desired gene should be operably linked to the expression control sequence and maintain the appropriate reading frame to permit production of the desired synthase. Any of a wide variety of well-known expression vectors are of use in the present invention. These include, for example, vectors consisting of segments of chromosomal, non-chromosomal and synthetic DNA sequences such as those derived from SV40, bacterial plasmids (including those from E. coli such as col E1, pCR1, pBR322 and derivatives thereof, pMB9), wider host range plasmids such as RP4, phage DNA such as phage λ , NM989, M13, and other such systems as described by Sambrook et al., (Molecular Cloning, A Laboratory Manual, 2^{nd} Ed. (1989) Cold Spring Harbor Laboratory Press).

A wide variety of host cells are available for expressing synthase mutants of the present invention. Such host cells include, without limitation, bacteria such as E. coli, Bacillus and Streptomyces, fungi, yeast, animal cells, plant cells, insect cells, and the like. Preferred embodiments of the present invention include terpene synthase mutants that are expressed in E. coli or in plant cells. Said plant cells can either be in suspension culture or a culture on a solid support such as an agar-based medium.

Genes encoding synthases of the present invention can also be expressed in transgenic plant cells. In order to produce transgenic plants, vectors containing a nucleic acid construct encoding a mutant terpene synthase are inserted

into the plant genome. Preferably, these recombinant vectors are capable of stable integration into the plant genome. One variable in making a transgenic plant is the choice of a selectable marker gene. A selectable marker gene is used to identify transformed cells against a high background of untransformed cells. Such selectable marker genes include but are not limited to aminoglycoside phosphotransferase gene of transposon Tn5 (Aph II) which encodes resistance to the antibiotics kanamycin, neomycin, and G418, as well as those genes which encode for resistance or tolerance to glyphosate, hygromycin, methotrexate, phosphinothricin, imidazolinones, sulfonylureas, and triazolophyrimidine herbicides, such as chlorosulfuron.

bromoxynil, dalapon and the like. In addition to a selectable marker gene, it may be desirable to use a reporter gene. In some instances a reporter gene may be used with a selectable marker. Reporter genes allow the detection of transformed cell and may be used at the discretion of the artisan. A list of these reporter genes is provided in K. Weising et al., 1988, Ann. Rev. Genetics, 22:421.

15

10

The genes are expressed either by promoters expressing in all tissues at all times (constitutive promoters), by promoters expressing in specific tissues (tissue-specific promoters), promoters expressing at specific stages of development (developmental promoters), and/or promoter expression in response to a stimulus or stimuli (inducible promoters). The choice of these is at the discretion of the artisan.

20

25

30

Several techniques exist for introducing foreign genes into plant cells, and for obtaining plants that stably maintain and express the introduced gene. Such techniques include acceleration of genetic material coated directly into cells (U.S. Patent 4,945,050). Plant may also be transformed using Agrobacterium technology (U.S. Patents 5,177,010, 5,104,310, 5,149,645, 5,469,976, 5,464,763, 4,940,838, 4,693,976, 5,591,616, 5,231,019, 5,463,174, 4,762,785, 5,004,863, and 5,159,135; European Patent Applications 116718, 290799, 320500, 604662, 627752, 0267159, and 0292435. Other transformation technologies include whiskers technology, see U. S. Patents 5,302,523 and 5,464,765. Electroporation technology has also been used to transform plants, see WO 87/06614, WO 92/09696 and WO 93/21335 and U.S. Patents 5,472,869 and 5,384,253. Viral vector expression systems can also be used such as those described in U.S. Patent 5,316,931, 5,589,367, 5,811,653, and 5.866.785.

35

of tissue that is contacted with the genes of interest may vary as well. Suitable tissue includes, but is not limited to, embryogenic tissue, callus tissue, hypocotyl, meristem and the like. Almost all plant tissues may be transformed during dedifferentiation using the appropriate techniques described herein.

In addition to numerous technologies for transforming plants, the type

Regardless of the transformation system used, a gene encoding a mutant synthase is preferably incorporated into a gene transfer vector adapted to express said gene in a plant cell by including in the vector an expression control sequence (plant promoter regulatory element). In addition to plant promoter regulatory elements, promoter regulatory elements from a variety of sources can be used efficiently in plant cells to express foreign genes. For example, promoter regulatory elements of bacterial origin, such as the octopine synthase promoter, the nopaline synthase promoter, the mannopine synthase promoter may be used. Promoters of viral origin, such as the cauliflower mosaic virus (35S and 19S) are also desirable. Plant promoter regulatory elements also include, but are not limited to, ribulose-1,6-bisphosphate carboxylase small subunit promoter, beta-conglycinin promoter, phaseolin promoter, ADH promoter, heat-shock promoters, and tissue specific promoters and the like. Numerous promoters are available to skilled artisans for use at their discretion.

It should be understood that not all expression vectors and expression systems function in the same way to express the mutated gene sequences of the present invention. Neither do all host cells function equally well with the same expression system. However, one skilled in the art may make a selection among these vectors, expression control sequences, and host without undue experimentation and without departing from the scope of this invention.

Once a synthase of the present invention is expressed, the protein obtained therefrom can be purified so that structural analysis, modeling, and/or biochemical analysis can be performed, as exemplified herein. The nature of the protein obtained can be dependent on the expression system used. For example, genes, when expressed in mammalian or other eukaryotic cells, may contain latent signal sequences that may result in glycosylation, phosphorylation, or other post-translational modifications, which may or may not alter function. Once the proteins are expressed, they can be easily isolated and purified using techniques common to the person having ordinary skill in the art of protein biochemistry and as described in Colligan et al., (1997) Current Protocols in Protein Science, Chanda, V.B., Ed., John Wiley & Sons, Inc. Such techniques often include the use of cation-exchange or anion-exchange chromatography, gel filtration-size exclusion chromatography, and the like. Another technique that may be commonly used is affinity chromatography. Affinity chromatography can include the use of antibodies, substrate analogs, or histidine residues (His-tag technology).

Once purified, mutants of the present invention may be characterized by any of several different properties. For example, such mutants may have altered

active site surface charges of one or more charge units. In addition, the mutants may have an altered substrate specificity or spectrum of reaction product relative to a non-mutated synthase.

The present invention allows for the characterization of mutant terpene synthase by crystallization followed by X-ray diffraction. Polypeptide crystallization occurs in solutions where the polypeptide concentration exceeds it solubility maximum (i.e., the polypeptide solution is supersaturated). Such solutions may be restored to equilibrium by reducing the polypeptide concentration, preferably through precipitation of the polypeptide crystals. Often polypeptides may be induced to crystallize from supersaturated solutions by adding agents that after the polypeptide surface charges or perturb the interaction between the polypeptide and bulk water to promote associations that lead to crystallization.

Compounds known as "precipitants" are often used to decrease the solubility of the polypeptide in a concentrated solution by forming an energetically unfavorable precipitating depleted layer around the polypeptide molecules (Weber, 1991, Advances in Protein Chemistry, 41:1-36). In addition to precipitants, other materials are sometimes added to the polypeptide crystallization solution. These include buffers to adjust the pH of the solution and salts to reduce the solubility of the polypeptide. Various precipitants are known in the art and include the following: ethanol, 3-ethyl-2-4 pentanediol, and many of the polyglycols, such as polyethylene glycol.

Commonly used polypeptide crystallization methods include the following techniques: batch, hanging drop, seed initiation, and dialysis. In each of these methods, it is important to promote continued crystallization after nucleation by maintaining a supersaturated solution. In the batch method, polypeptide is mixed with precipitants to achieve supersaturation, the vessel is sealed and set aside until crystals appear. In the dialysis method, polypeptide is retained in a sealed dialysis membrane that is placed into a solution containing precipitant. Equilibration across the membrane increases the polypeptide and precipitant concentrations thereby causing the polypeptide to reach supersaturation levels.

In the preferred hanging drop technique (McPherson, 1976, J. Biol. Chem., 6300-6306), an initial polypeptide mixture is created by adding a precipitant to a concentrated polypeptide solution. The concentrations of the polypeptide and precipitants are such that in this initial form, the polypeptide does not crystallize. A small drop of this mixture is placed on a glass slide that is inverted and suspended over a reservoir of a second solution. The system is then sealed. Typically, the second solution contains a higher concentration of precipitant or other dehydrating

agent. The difference in the precipitant concentrations causes the protein solution to have a higher vapor pressure than the solution. Since the system containing the two solutions is sealed, an equilibrium is established, and water from the polypeptide mixture transfers to the second solution. This equilibrium increases the polypeptide and precipitant concentration in the polypeptide solution. At the critical concentration of polypeptide and precipitant, a crystal of the polypeptide may form.

Another method of crystallization introduces a nucleation site into a concentrated polypeptide solution. Generally, a concentrated polypeptide solution is prepared and a seed crystal of the polypeptide is introduced into this solution. If the concentration of the polypeptide and any precipitants are correct, the seed crystal will provide a nucleation site around which larger crystal forms. In preferred embodiments, the crystals of the present invention are formed in hanging drops with 15% PEG 8000; 200 mM magnesium acetate or magnesium chloride, 100 mM 3-(N-morpholino)-2-hydroxypropanesulfonic acid (pH 7.0), 1 mM dithiothreitol as precipitant.

Some proteins may be recalcitrant to crystallization. However, several techniques are available to the skilled artisan to induce crystallization. The removal of polypeptide segments at the amino or carboxyl terminal end of the protein may facilitate production of crystalline protein samples. Removal of such segments can be done using molecular biology techniques or treatment of the protein with proteases such as trypsin, chymotrypsin, subtilisin. Such procedures can result in the removal of flexible polypeptide segments that may negatively affect crystallization.

The crystals so produced have a wide range of uses. For example, high quality crystals are suitable for X-ray or neutron diffraction analysis to determine the three-dimensional structure of a mutant synthase and to design additional mutants thereof. In addition, crystallization can serve as a further purification method. In some instances, a polypeptide or protein will crystallize from a heterogeneous mixture into crystals. Isolation of such crystals by filtration, centrifugation, etc., followed by redissolving the polypeptide affords a purified solution suitable for use in growing the high-quality crystals needed for diffraction studies. The high-quality crystals may also be dissolved in water and then formulated to provide an aqueous solution having other uses as desired.

Because synthases may crystallize in more than one crystal form, the structural coordinates of α -carbons of an active site determined from a synthase or portions thereof, as provided by this invention, are particularly useful to solve the structure of other crystal forms of synthases. The structural coordinates, as provided

10

15

20

25

30

35

herein, may also be used to solve the structure of synthases having α-carbons position within the active sites in a manner similar to the wild-type yet having R-groups that may or may not be identical. Furthermore, the structural coordinates disclosed herein may be used to determine the structure of the crystalline form of other proteins with significant amino acid or structural homology to any functional domain of a synthase. One method that may be employed for such purpose is molecular replacement. In this method, the unknown crystal structure, whether it is another crystal form of a synthase, a synthase having a mutated active site, or the crystal of some other protein with significant sequence identity and/or structural homology of a synthase may be determined using the coordinates given in Tables 10 and/or 11. This method provides sufficient structural form for the unknown crystal more efficiently than attempting to determine such information ab initio. In addition, this method can be used to determine whether or not a given synthase in question falls within the scope of this invention.

As further disclosed herein, synthases and mutants thereof may be crystallized in the presence or absence of substrates and substrate analogs. The crystal structures of a series of complexes may then be solved by molecular replacement and compared to that of the wild-type to assist in determination of suitable replacements for R-groups within the active site, thus making synthase mutants according to the present invention.

All mutants of the present inventions may be modeled using the information disclosed herein without necessarily having to crystallize and solve the structure for each and every mutant. For example, one skilled in the art may use one of several specialized computer programs to assist in the process of designing synthases having mutated active sites. Examples of such programs can be as follows: GRID (Goodford, 1985, J. Med. Chem., 28:849-857); MCSS (Miranker and Karplus, 1991, Proteins: Structure, Function and Genetics, 11:29-34); AUTODOCK (Goodsell and Olsen, 1990, Proteins: Structure, Function, and Genetics, 8:195-202); and DOCK (Kuntz et al., 1982, J. Mol. Biol., 161:269-288). In addition, specific computer programs are also available to evaluate specific substrate-active site interactions and the deformation energies and electrostatic interactions resulting therefrom. MODELLER is a computer program often used for homology or comparative modeling of the three-dimensional structure of a protein. A. Sali & T.L. Blundell, J.Mol.Biol. 234, 779-815, 1993. A preselected polypeptide sequence to be modeled is aligned with one or more terpene synthases whose crystal structures are known and the MODELLER program is used to calculate a full-atom model, based on optimum satisfaction of spatial restraints. Such restraints can include, inter alia,

homologous structures, fluorescence spectroscopy, NMR experiments, or atom-atom potentials of mean force.

The present invention enables synthase mutants to be made and crystal structures thereof to be solved. Moreover, by virtue of the present invention, the location of the active site and the interface of substrate therewith permit the identification of desirable R-groups for mutagenesis. The particular embodiments of this invention are further exemplified in the Examples. However, those skilled in the art will readily appreciate that the specific experiments detailed are only illustrative of the invention as described more fully in the claims, which follow thereafter.

EXAMPLE 1

GENERATION OF MUTANT TEAS GENES

15 Construct generation and expression.

All mutant enzymes were constructed by the QuickChange method (Stratagene). Manufacturer's instructions were followed, except as noted. Mutations were confirmed by DNA sequencing, and plasmids containing the desired mutation were used to transform BL-21(DE3) expression cells. Protein was expressed, purified, and stored at -80°C.

20

TEAS W273S. The TEAS W273S mutant was generated from a TEAS-pET28b(+) template using the following primers:
GTTGAATGCTACTTTTCGGCATTAGGAGTTTAT (sense) (SEQ ID NO:13) and

ATAAACTCCTAATGCCGAAAAGTAGCATTCAAC (antisense) (SEQ ID NO:14).

Mutagenesis was carried out according to the manufacturer's instructions, except that sense and antisense strands were generated in separate reactions. For each, 30 plasmid-copying cycles of one minute, annealing at 55°C and 16 minutes extension at 68°C were carried out. The two reaction mixtures were then combined, heated to 95°C for 2.5 minutes, and cooled to room temperature before DpnI treatment.

30

TEAS C440W. The TEAS C440W mutant was generated from the TEAS-pET28b(+) template using the following primers:
GCTAGTGTAATTATATGGCGAGTTATCGATGAC
(sense) (SEQ ID NO:15) and GTCATCGATAACTCGCCATATAATTACACTAGC (antisense) (SEQ ID NO:16).

35

TEAS W273S/C440W. The TEAS C440W/W273S mutant was constructed from a TEAS W273S-pET28b(+) template using the primers described for generation of TEAS C440W.

10

15

20

25

30

35

TEAS 406/407 random library. For generation of a library of TEAS mutants with random amino acids at positions 406 and 407, two 50 microliter QuickChange reactions were carried out with the TEAS-pET28b(+) template and the primers

GCACTAGCAACTACCACATATTACNNSNNSGCGACAACATCGTATTTGGGCATG (sense) (SEQ ID NO:17) and CATGCCCAAATACGATGTTGTCGCSNNSNNGTAATATGTGGTAGTTGCTAGTGC (antisense) (SEQ ID NO:18), in which N denotes A, C, G, or T and S denotes C or G. By this choice of nucleotides, the reaction included primers which coded for all possible amino acid combinations at positions 406 and 407. No adjustment was made for differing numbers of codons among amino acids. In order to ensure efficient reactions, and to minimize the preference for hybridization of wild-type primers to the template, the primers were designed to be longer than those used to generate the mutations described above. In addition, they were HPLC purified prior to use. After 18 cycles of plasmid copying, the reaction was incubated for two hours with DpnI, ethanol precipitated, and redissolved in 5 microliters water. Each of four 40 microliter aliquots of E. coli NovaBlue (Novagen) cells were electroporated with 1.5 microliters of the redissolved DNA. After a recovery period, the cells were plated on kanamycin-LB-agar plates. In order to transfer the newly constructed plasmids to expression cells, the colonies were scraped from all four plates, and used to start an 8 mL culture grown in liquid LB medium at 37°C for 8 hours. Plasmid purified from this culture was used to transform 20 microliters of competent BL-21(DE3) cells.

For storage of the constructs, each individual colony was used to inoculate 100 microliters of LB medium containing kanamycin (50 micrograms/mL) in 96-well culture plates. The cells were grown at 37°C until the A₆₀₀ reached approximately one; 100 microliters of 30% glycerol in LB were then added, and the plates were frozen at -80°C. A set of randomly selected colonies were grown from individual glycerol stocks of some colonies, and plasmids were extracted for sequencing. Approximately 30 percent of the colonies were found to be wild-type. Nucleotide and amino acid sequences for TEAS 406/407 mutant genes and proteins are shown in SEQ ID NOS:11 and 12.

TEAS Y520F The tyrosine residue at position 520 of SEQ1D No:2 was changed to a phenylalanine residue by site-directed mutagenesis with primers, in a manner similar to that described above. For Y520F the TAT codon was changed to TTC. The nucleotide sequence of the mutant gene is shown in SEQ ID No:5.

TEAS Y527F The tyrosine residue at position 527 of SEQ ID No:2 was changed to a phenylalanine residue by site-directed mutagenesis with primers,

in a manner similar to that described above. For Y527F, the TAC codon at position 527 of the TEAS amino acid sequence was changed to TTC. The nucleotide sequence of the mutant TEAS Y527F gene is shown in SEQ ID No: 7.

TEAS W273E The tryptophan residue at position 273 of SEQ ID No:2 was changed to a phenylalanine residue by site-directed mutagenesis with primers, in a manner similar to that described above. For W273E, the TGG codon at position 273 of the TEAS amino acid sequence was changed to GAG. The nucleotide sequence of the mutant gene is shown in SEQ ID No.:3.

EXAMPLE 2 EXPRESSION AND ISOLATION OF SYNTHASE POLYPEPTIDES

Unless otherwise noted, mutated and non-mutated TEAS proteins were expressed in Escherichia coli, purified by metal chelation, anion exchange, and gel filtration chromatography.

Constructs of TEAS and mutant TEAS proteins in the vector pET-28b(+) (Novagen) were expressed in E. coli cells. For a typical protein preparation of any of these enzymes, E. coli strain BL21(DE3) cells containing the plasmid construct were grown at 37°C in 4 X 1L terrific broth to an A₆₀₀ = 1.0. The temperature was dropped to 22°C, and protein expression was induced by adding IPTG to a final concentration of 0.1 mM. After 15-20 h, the cells were harvested by centrifugation, resuspended in 5mL buffer A (20 mM Tris , 500 mM NaCl, 20 mM imidazole, pH 7.9) per 1g cells (wet weight), and stirred for 0.5 h at 4°C. The cells were then lysed by sonication, and the resulting lysate was centrifuged for 0.7 h at 82,000 xg. The supernatant, containing the protein, was loaded over a 2-3 mL Ni²⁺ chelating histidine affinity column (Qiagen) equilibrated in buffer A, and the column was washed with additional buffer A until the A₂₈₀ of the eluent returned to baseline. The protein was then eluted with a 20-200 mM imidazole gradient in buffer A. Protein-containing fractions were pooled and dialyzed against buffer B (50 mM HEPES, 5mM MgCl2, 1mM DTT), then loaded onto an 8 mL MonoQ cation-exchange column (Pharmacia). The column was washed with 20 column volumes buffer B, and the protein was eluted with a 0-500 mM NaCl gradient in buffer B. The resulting protein was further purified by gel filtration on a Superdex-200 column (Pharmacia) in 50 mM Tris, 100 mM NaCl, 5mM MgCl2, 1mM DTT, pH 8.0. Purified protein was then dialyzed against 5mM Tris, 5mM NaCl, 1mM DTT, pH 8.0, concentrated to 18-22 mg/mL, and stored at -80°C in 100° L aliquots until needed.

EXAMPLE 3

CRYSTALLIZATION AND STRUCTURAL ANALYSIS OF SYNTHASE POLYPEPTIDES

5

10

15

20

25

30

35

Crystal Growth and Microseeding: All crystallization attempts were carried out by the hanging-drop vapor diffusion method. Concentrated protein was mixed with an equal volume (2-5 uL each) of reservoir solution on a plastic cover sup. The cover slip was then inverted over a well of a plastic 24-well tissue culture plate. containing 0.5-1.0 mL of reservoir solution, and sealed by a layer of vacuum grease between the well and cover slip. The plates were incubated at 4°C while the protein concentration in the hanging drop slowly increased by vapor diffusion. Approximately 300 different reservoir solutions, ranging pH 4.5-9 with a variety of precipitants and added salts, were assayed for crystallization of TEAS (SEQ ID NO:2). TEAS crystallized with a reservoir solution of 15% PEG 8000, 100 mM MOPSO (3-[Nmorpholino]-2-hydroxypropanesulfonic acid), 200 mM magnesium acetate, 1 mM DTT, pH 6.9-7.3. For microseeding, an existing crystal was crushed in a few uL of precipitant solution, then diluted to 50 microliters. After initial centrifugation to remove large particles, the suspension was serially diluted with additional precipitant solution, and a small volume of a diluted seed stock was added to each new crystallization drop. For macroseeding, crystals which were no longer rapidly growing (usually 2 weeks after drops were set up), were "rinsed" by serially transferring them through two to three drops of reservoir solution. The crystal was then transferred to a fresh drop containing protein and reservoir solution, and equilibrated against a reservoir solution as in the initial growth. Individual crystals varied in their degree of internal order. In some cases, several crystals were screened to identify a well-diffracting crystal with low mosaicity.

Data collection: Prior to data collection, crystals were transferred to a drop of reservoir solution, or reservoir solution containing a compound to be soaked into the crystal. A small volume of cryoprotectant solution (15% PEG8000, 100 mM MOPSO, 200 mM Mg acetate, 20% ethylene glycol, 1mM DTT, pH 7) was then added to the drop. After a short equilibration time (1-5 minutes), the crystal was transferred to a drop of cryoprotectant, or cryoprotectant with soaking compound added. After another short equilibration time, the crystal was picked up on a nylon loop, and quickly mounted for data collection in a stream of cold nitrogen gas (90-110K).

10

15

20

25

30

35

The TEAS crystals belonged to the tetragonal space group P4₁2₁2; the unit cell dimensions varied by a few angstroms between crystals, but on average a = 126Å, c = 122 Å. The uncomplexed TEAS structure was initially refined to 2.8 Å (Table 11) against data collected from a crystal grown in the presence of 2 mM FHP (Table 10). Electron density at the active site allowed unambiguous modeling of FHP, the A-C and J-K loops, and nine additional residues at the NH₂ terminus. The refined TEAS-FHP model consisted of residues 17 to 548, three Mg² + ions. 150 water molecules, and one FHP molecule. The three-dimensional coordinates for TEAS in the presence of bound substrate is shown in Table 10. The three-dimensional coordinates for TEAS in the absence of FHP is shown in Table 11.

Crystals of TEAS complexed with trifluoro-farnesyl diphosphate (F3-FPP) were also prepared. In these crystals, a well-ordered diphosphate binding pocket was also observed. The A-C loop and the NH2-terminal segment exhibited well-defined electron density, the A-C loop was translated toward the active site, and there was strong electron density for the diphosphate moiety of F3-FPP. The hydrophobic pocket, however, remained flexible; the J-K loop and the farnesyl moiety of F3-FPP were disordered.

Homology models were created and energy-minimized using the Swiss PDB viewer interface of the SwissModel program (Peitsch MC (1996), Biochem. Soc. Trans., 24:274–279 and Guex N. and Peitsch MC, 1997, Electrophoresis., 18:2714–2723). Active site volumes were calculated with VOIDOO (Kleywegt, G.J., and Jones, T.A., CCP4/ESF-EACBM Newsletter on Protein Crystallography., 29, 26-28, 1993). To make closed active site cavities, the energy-minimized diphosphate moiety from the modeled TEAS cyclase reaction was appended to the residue equivalent to TEAS D301.

TEAS W273S crystal structures. Two TEAS W273S structures, in the presence of FHP, were determined from different crystals; both crystals appeared to be well ordered, as clear main-chain and side-chain density were apparent for residues throughout the protein, including the frequently mobile helices D1, D2, and E. Initial difference electron density maps from both crystals immediately revealed the W273S mutations. The two crystals were designated W273S-1 and W273S-2.

In each structure, the loops surrounding the active site were ordered, resulting in a closed active site pocket. The A/C loop in each structure was translated toward the active site, forming part of its outer rim, as observed in the wild-type TEAS/FHP complex. However, while the J/K loop of W273S-1 adopted the same conformation observed in the wild-type TEAS/FHP complex, the same loop in W273S-2 adopted a different conformation. In this conformation of the J/K loop,

10

15

20

25

30

35

Tyr527 moved away from the side chain of residue 273. In addition, Tyr520 and Asp525 were placed distal to the side chain of Asp444. Hydrogen bonds previously observed between the J/K loop, Arg266, and the N-terminal loop were also missing in the W273S-2 structure.

The W273S-2 conformation does not appear to be an effect of the W273S mutation, as it was also observed in a wild-type TEAS crystal soaked with the epi-aristolochene mimic deoxycapsidiol, despite the fact that no electron density was readily apparent for the deoxycapsidiol molecule in that structure. Further, the TEAS active site loops were distant from crystal contacts, and their conformations were not likely to be artifacts of crystal packing. It is possible that at different stages of the TEAS reaction, the enzyme's J/K loop exists in different, defined conformations, and that each of these crystal structures has captured an image of a different conformation. In both W273S structures, residues other than Arg266 and those on the J/K loop did not undergo significant rearrangement from the conformations observed in wild-type TEAS.

In each W273S crystal structure, electron density in the active site suggested that the substrate mimic FHP binds in multiple conformations. Some regions of this density possibly represented bound water molecules in the mutant active site. The presence of water molecules in the mutant active site is consistent with the observation that TEAS W273S gives rise to multiple hydroxylated terpenoid reaction products.

The FHP electron density in each W273S crystal structure was sufficient to suggest that FHP existed in a more extended conformation in the W273S structure, compared to the more tightly folded conformation of FHP in the wild-type TEAS/FHP complex. The observation that the active site of W273S binds multiple conformations of FHP is consistent with the fact that W273S converts FPP to multiple terpenoid hydrocarbon products.

TEAS C440W / W273S: TEAS C440W / W273S crystallized under conditions identical to wild-type TEAS. A 0.3 mm crystal was soaked for 20 minutes in reservoir solution saturated in farnesyl hydroxy phosphate (FHP). After cryoprotection and flash freezing as described for wild-type TEAS, data were collected on a laboratory source with Cu-Kα radiation (MacScience Corp., Japan). A starting model of uncomplexed TEAS (Table 11) (Brookhaven Protein Database Code 5EAT (PDB 5EAT), with waters and magnesiums removed, was positioned against the mutant data with the rigid body module of the software program X-PLOR (A.T. Brunge, X-PLOR Version 3.1 – A System for X-Ray Crystallography and NMR Yale University Press, New Haven, 1992, pp. 187-207). Rounds of positional and

restrained b-factor refinement with bulk solvent modeling were also carried out in X-PLOR, with manual model building and adjustment carried out in the software program O (Jones, TA, Zou, JY, Cowan, SW, and Kjeldgaard, M., Acta Cryst. D., 49:148-157, 1993). Additional rounds of refinement and map calculation using the CNS program suite resulted in significantly improved maps; this improvement was likely due to improved bulk solvent modeling.

TEAS C440W: TEAS C440W crystallized under conditions identical to wild-type TEAS, except that crystals riucleated less readily and were generally smaller. A mutant crystal was soaked for 6 hours in reservoir solution saturated in FHP before flash-freezing and data collection at SSRL beamline 7-1 (Stanford Synchrotoon Radiation Laboratory, Menlo Park, California). A starting model of TEAS-FHP (Table 10), with water molecules, ligands, and residues 523-532 of SEQ ID NO:2 removed, was positioned against the data with the rigid body module of X-PLOR. Rounds of positional and restrained b-factor refinement with bulk solvent and overall anisotropic temperature factor modeling were also carried out in X-PLOR, and manual model building and adjustment were carried out in the software program O. As with the double mutant, electron density maps were noticeably improved after refinement and map calculation in CNS.

15

EXAMPLE 4 TERPENE SYNTHASE ENZYME ASSAYS

Synthase activity assays were carried out based on the assay described in Vogeli and Chappell, Plant Physiol. 94:1860 (1990) and Vogeli, et al., Plant Physiol. 93:182 (1990). In general, radio-labeled (³H or ¹⁴C) substrate was incubated with enzyme at room temperature in a buffered magnesium salt solution (200 mM Tris, pH 8, 50 mM Mg chloride, 1mM DTT, unless otherwise noted); hydrocarbon products were then selectively extracted into an organic solvent such as hexane. The hexane extract generally was treated with silica gel to remove prenyl alcohols and other oxygenated compounds generated by non-enzymatic hydrolysis of substrate, which partition inefficiently into hexane. Hydrocarbon products present in the hexane phase were quantitated by scintillation counting.

A subsequent extraction with a more polar organic solvent such as ethyl acetate was sometimes carried out. Oxygenated compounds more efficiently partition into ethyl acetate-type solvents. Compounds present in the ethyl acetate phase were also quantitated by scintillation counting.

10

15

20

25

30

35

use of fluorography spray.

Substrate concentrations typically ranged from 0.1 nanomolar to 100 micromolar. In some assays, the substrate was not radiolabeled. Reactions generally were carried out in triplicate for each substrate concentration. Protein concentration was determined by the Bradford method. For determination of steady-state kinetic parameters, enzyme concentrations were chosen such that generation of products over time was linear throughout the course of the reaction.

Diterpene synthase assays typically were carried out using ³H geranylgeranyl diphosphate (GGPP) and enzyme in 250 mM Tris, 10 mM Mg chloride, 1mM DTT, pH 8.0. Sesquiterpene synthase assays typically were carried out using ¹⁴C or ³H FPP and enzyme in 100mM Tris, 30 mM Mg chloride, 1 mM DTT, pH 8.0. Monoterpene synthase assays typically were carried out using ³H GPP and enzyme. As a control for nonspecific binding of GPP by protein, identical reactions were set up which contained BSA, rather than enzyme.

Product analysis of wild type and mutant TEAS enzymes by Ag-TLC. Terpenoid hydrocarbon products are not readily separated by thin layer chromatography on normal or reverse-phase plates; however, some can be separated by argentation TLC (Ag-TLC), in which silica plates are first treated with silver nitrate. Ag-TLC described here generally followed the procedure described by Back et al., Arch. Biochem. Biophys. 315:527 (1994). A silica TLC plate was dipped in 15% silver nitrate (aqueous), then dried for 3-5 hours at 110°C. After spotting of tritiated enzymatic products (solvent extract), the plate was developed in benzene:hexane, ethyl acetate (50:50:1, by volume), sprayed with En³Hance (NEN) fluorography spray, placed on film, and exposed for several days to several weeks. Long exposure times were generally necessary, as silver-nitrate treatment of the TLC plate appeared to cause quenching of the fluorography reagent's fluorescence. Alternatively, ¹⁴C labelled products were detected after one to two days without the

EXAMPLE 5 ACTIVITY OF TEAS W273S

Diterpene Synthase Activity of TEAS W273S. The TEAS W273S enzyme and radiolabelled GGPP were incubated as described above and hydrocarbon products were extracted with hexane. Oxygenated products were then extracted with ethyl acetate. Reactions using wild-type TEAS gave counts lower than buffer alone. TEAS W273S, on the other hand, gave counts that were significantly

10

15

20

25

30

35

higher for both the hexane and ethyl acetate extracts. Hydrocarbon products formed from GGPP by W273S were distinct from the products made by acid-catalyzed loss of diphosphates from GGPP. See Figure 3.

Sesquiterpene Synthase Activity of TEAS W273S. Products of FPP turnover by the purified TEAS W273S mutant were analyzed by argentation thin-layer chromatography (Ag-TLC). One major reaction product had an R_f of 0.7 by Ag-TLC, which was distinct from both 5-epi-aristolochene (R_f = 0.78) and vetispiradiene (R_f = 0.63). See Figure 4. Preliminary GC/MS data showed that hexane extracts from FPP turnover by TEAS W273S contained at least four terpene hydrocarbons, with mass spectra distinct from either 5-epi-aristolochene or vetispiradiene. One of these products had a mass spectrum similar to germacrene A.

EXAMPLE 6

ACTIVITY OF TEAS C440W/W273S

Diterpene Synthase Activity of TEAS C440W/W273S. The mutant TEAS C440W/W273S protein contains a tryptophan residue at position 440 and a serine residue at position 273. Assays with GGPP were carried out using 0.5 micromolar ³H GGPP, various concentrations of unlabelled GGPP (Echelon), and enzyme. Reactions were incubated for 60 minutes at room temperature. The TEAS C440W/W273S mutant protein converted GGPP to hexane-extractable products, whereas the wild-type enzyme did not. The results indicated that the product profile was altered compared to wild-type TEAS. Hexane-extractable products of GGPP turnover by the double mutant were analyzed by Ag-TLC. The products included two species (R_f = 0.11 and 0.28) that were distinct from the hydrolysis product geranyl geraniol (R_f = 0.0). To verify that products generated by TEAS C440W/W273S from GGPP were not the hydrolysis product, geranylgeraniol, a sample was analyzed by Aq-TLC. A reaction containing ³H GGPP (5μm) and enzyme (40μm) in 100 microliters buffer was incubated overnight at room temperature. As controls, ³H GGPP was incubated in reaction buffer alone and in reaction buffer adjusted to pH 1.5. Both the enzymatic and control reactions were extracted with hexane, which was spotted on an argentation TLC plate, and developed and exposed as described above. The results, shown in Figure 3, demonstrated that the products formed by TEAS C440W/W273S were different from those generated by non-enzymatic degradation of geranylgeranyl diphosphate.

Sesquiterpene Synthase Activity of TEAS C440W/W273S.

Reactions with FPP as substrate were carried out with ^{14}C FPP (9 μ m) and enzyme (160 μ m) in reaction buffer (20 μ l). After incubating for 30 minutes at room temperature, products made by TEAS C440W / W273S were analyzed by Ag-TLC.

The product profile of the double mutant was similar to that of TEAS W273S, with the addition of a major product having an R_f of 0.57. The new product was distinct from both 5-epi-aristolochene and vetispiradiene. Several other products were also formed, many of which migrated slowly upon argentation TLC. See Fig. 4.

10

` 15

20

5

EXAMPLE 7 ACTIVITY OF TEAS C440W

Diterpene Synthase Activity of TEAS C440W. Enzyme assays with TEAS C440W were carried out as described in Example 6. As shown in Fig. 3, no hexane-extractable products were detectable by Ag-TLC after an overnight incubation at room temperature with 160 μ m of enzyme and 9 μ m radiolabeled GGPP in 20 μ l volume.

Sesquiterpene Synthase Activity of TEAS C440W. Ag-TLC analysis of the products made from radiolabelled by purified TEAS C440W detected the formation at least one major terpenoid hydrocarbon product (R_f 0.63) that was distinct from 5-epi-aristolochene (R_f 0.78) and vetispiradiene. The reactions product profile on Ag-TLC is shown in Fig. 4. Small amounts of slowly-migrating products (R_f 0-0.09) were also formed.

GC/MS analysis of the hexane extract of TEAS C440W terpenoid hydrocarbon reaction products confirmed that this mutant formed a single major sesquiterpene hydrocarbon product as well as a small number of minor hydroxylated products. The mass spectrum of the major product closely matched the published mass spectrum of the spirocyclic compound hinesene. Hinesene differs from vetispiradiene in the stereochemistry at the C3 methyl group.

EXAMPLE 8 ACTIVITY OF TEAS W273E

Sesquiterpene Synthase Activity of TEAS W273E. Reactions to determine the products made by TEAS W273E using FPP as substrate were carried out essentially as described above, using radiolabeled FPP. The results indicated that at least one product other than 5-epi-aristolochene was formed. The results also indicated that alkylation of TEAS by FPP had occurred. The alkylation was dependent upon the presence of MgCl₂ in the reaction mixture. In control experiments, boiled W273E-TEAS, as well as wild-type TEAS and BSA, were not alkylated. These results indicate that alkylation had occurred at position 273 and that the amino acid residue at position 273 is part of the active site.

15

10

5

EXAMPLE 9 ACTIVITY OF TEAS Y520F

radiolabeled FPP and TEAS Y520F enzyme were carried out essentially as described above. Reaction products were analysed by Ag-TLC and by GC/MS. A major product of the TEAS Y520F reaction had the same GC retention time as authentic germacrene A and the same mass spectrum as authentic germacrene A. The retention time and mass spectrum of this product were different from 5-epi-aristolochene.

EXAMPLE 10 ACTIVITY OF TEAS Y527F

enzyme was made by inducing expression in E. coli cells, and sonicating the cells. The sonicate was clarified and the supernatant used for enzyme assays. No products were observed in assays using GPP as a substrate, indicating that TEAS Y527F does not have monoterpene synthase activity. Reaction products were obtained using FPP as a substrate. Analysis of these products by Ag-TLC indicated that products other than 5-epi-aristolochene were generated by the TEAS Y527F enzyme.

Residues 265 to 535 of the TEAS primary amino acid sequence (SEQ ID NO: 2) were aligned with the full-length amino acid sequence of a limonene synthase (SEQ ID NO: 22), using the BLASTp program (NCBI) with a BLOSUM 62 scoring matrix, a gap open value of 11, a gap extension value of 1, an x_dropoff value of 50, an expect value of 10, a wordsize of 3 and no filtering of low complexity sequences. The output of the alignment program, shown in Table 12, included a gap between residues 527 and 528 of the TEAS sequence (numbered as 263 and 264 in the alignment output). Residues 321, 324, 345, 348, 349, 427, 452, 453, 454, 455, 458, 492, 496, 569, 572, 573, 577, 579 and 580 were selected as having the most suitable alignment with the 19 TEAS residues. Residue 580 of limonene cyclase instead of residue 583 was selected as aligning with residue 528 of TEAS, in order to maintain the spatial orientation of structural aspects found in TEAS, i.e., α -helices, β -sheets and loops shown in Figure 1 and Table 10.

A region including residues 579 to 847 of the taxadiene primary amino 20 acid sequence of SEQ ID NO: 44 was aligned with the full-length amino acid sequence of a bornyl diphosphate synthase (SEQ ID NO: 26), using the BLASTp program (NCBI) with a BLOSUM 62 scoring matrix, a gap open value of 11, a gap extension value of 1, an x dropoff value of 50, an expect value of 10, a wordsize of 3 and no filtering of low complexity sequences. The output of the alignment program. 25 shown in Table 13, included a gap between residues 453 and 454 of the bornyl diphosphate synthase sequence. Residues 321, 324, 344, 347, 348, 426, 451, 452, 453, 454, 457, 492, 496, 568, 571, 572, 576, 578 and 579 of the bornyl diphosphate synthase were selected as having the most suitable alignment with residues 584, 587, 606, 609, 610, 688, 713, 714, 715, 716, 719, 753, 757, 831, 834, 835, 839, 841 and 842 of the query region sequence of SEQ ID NO: 44. Residues 453 and 454 of 30 bornyl diphosphate synthase were selected to align with residues 715 and 716 of taxadiene synthase, in order to maintain the spatial orientation of structural aspects expected to be present in taxadiene synthase, i.e., α -helices, β -sheets and loops shown in Figure 1 and Table 10.

Residues 265 to 535 of the TEAS primary amino acid sequence (SEQ ID NO: 2) were aligned with the full-length amino acid sequence of a δ -selinene

15

20

30

35

synthase (SEQ ID NO: 48), using the BLASTp program (NCBI) with a BLOSUM 50 scoring matrix, a gap open value of 13, a gap extension value of 2, an x_dropoff value of 50, an expect value of 10, a wordsize of 3 and no filtering of low complexity sequences. The output of the alignment program is shown in Table 14. Residues 300, 303, 324, 327, 328, 406, 431, 432, 433, 434, 437, 471, 475, 548, 551, 552, 556, 558 and 559 of SEQ ID NO:48 were selected as having the most suitable alignment with residues 270, 273, 294, 297, 298, 376, 401, 402, 403, 404, 407, 440, 444, 516, 519, 520, 525, 527 and 528 of SEQ ID NO: 2.

Residues 307 to 593 of the primary amino acid sequence of γ -humulene synthase (SEQ ID NO: 50) were aligned with the full-length amino acid sequence of abietadiene synthase (SEQ ID NO: 56), using the BLASTp program (NCBI) with a BLOSUM 62 scoring matrix, a gap open value of 11, a gap extension value of 1, an x_dropoff value of 50, an expect value of 10, a wordsize of 3 and no filtering of low complexity sequences. The output of the alignment program is shown in Table 15. Residues 590, 593, 614, 617, 618, 696, 721, 722, 723, 724, 727, 761, 765, 837, 840, 841, 845, 847 and 848 of the diterpene synthase (SEQ ID NO: 56) were selected as having the most suitable alignment with residues 312, 315, 336, 339, 340, 419, 444, 445, 446, 447, 450, 484, 488, 562, 565, 566, 570, 572 and 573 of the sesquiterpene synthase query sequence (SEQ ID NO: 50).

EXAMPLE 12

GENERATION OF NOVEL MONOTERPENE SYNTHASE GENES

A DNA sequence encoding a pinene synthase (SEQ ID NO:20) is used to construct a library of mutant pinene synthase genes. Random mutations are introduced at nucleotides encoding one or more of the following nine amino acid residues: L, C, C, G, H, S, L, G and Y, which correspond to positions 351, 372, 480, 481, 482, 485, 519, 600 and 601 of SEQ ID NO:20.

In some cases, the pinene synthase coding sequence is randomly mutated at nucleotides encoding one or more of amino acid residues 348, 375, 376, 597, 605, 607 and 608, which correspond to positions Y, I, T, F, D, Y and S of SEQ ID NO:20. The pinene synthase coding sequence is sometimes mutated at nucleotides encoding one or more of the following amino acid residues: Y, S and G, which correspond to positions 454, 479 and 523 of SEQ ID NO:20. In some cases, mutations at these ten positions are made in addition to mutations at nucleotides encoding the nine residues mentioned above. In other cases, mutations at these ten

positions are made without introducing mutations at the nine residues mentioned above.

The pinene synthase coding sequence DNA is inserted in the pET28b(+) vector and mutagenized using the QuickChange® method, following a protocol similar to that described in Example 1 for the TEAS 406/407 random library. The primers used to generate mutations are synthesized as indicated in Example 1, using N or S as nucleotides in the desired codons in order to generate random mutants.

Specific mutations at one or more of the above 19 pinene synthase amino acid residues are made by site-directed mutagenesis using a protocol similar to that described in Example 1 for TEAS. Primers are made that have specific A, T, C or G substitutions in the codons to be mutated, in order to generate the desired mutant(s).

Random and/or specific mutations are prepared in a manner similar to that described above to alter amino acid residues of other monoterpene synthases, e.g., limonene synthase, (SEQ ID NOS:22 or 58), myrcene synthase (SEQ ID NO:30), +sabinene synthase (SEQ ID NO:54), 1, 8 cineole synthase (SEQ ID NO:24) and +bornyl diphosphate synthase (SEQ ID NO:26), at residues whose α -carbons have the interatomic distances and structural coordinates described in Tables 1-6.

EXAMPLE 13

GENERATION OF NOVEL SESQUITERPENE SYNTHASE GENES

25

20

5

10

15

A DNA sequence encoding a cadinene synthase (SEQ ID NO:33) is used construct a library of mutant cadinene synthases. Random mutations are introduced at nucleotides encoding one or more of the following nine amino acid residues: W, I, S, G, Y, L, C, L and Y, which correspond to amino acid residues 280, 301, 409, 410, 411, 414, 448, 527 and 528 encoded by SEQ ID NO:33.

30

35

In some cases, the cadinene synthase coding sequence is mutated at nucleotides encoding one or more of amino acid residues G, A, S, M, D, Y and T, which correspond to amino acid residues 277, 304, 305, 524, 532, 534 and 535 encoded by SEQ ID NO:33. In addition, the cadinene synthase coding sequence is sometimes mutated at nucleotides encoding one or more of the following amino acid residues: 383, 408 and 452, which correspond to amino acids Y, T and D encoded by SEQ ID NO:33. In some cases, these mutations are made in addition to mutations at the nine residues mentioned above. In other cases, mutations at these

10

15

20

25

30

35

ten residues are made without introducing mutations at the nine residues mentioned above.

The cadinene synthase coding sequence is mutated using the QuickChange® method in the pET28b(+) vector, following a protocol similar to that described in Example 1 for the TEAS 406/407 random library. The primers used to generate mutations are synthesized as indicated in Example 11.

Specific mutations at one or more of the above cadinene synthase amino acid residues are made by site-directed mutagenesis using a protocol similar to that described in Example 1 for TEAS.

Random and/or specific mutations are prepared in a manner similar to that described above to alter amino acid residues of otner sesquiterpene synthases, e.g., vetispiradiene synthase (SEQ ID NO:32), germacrene C synthase (SEQ ID NO:52), E-alpha-bisabolene synthase (SEQ ID NO:46), gamma-humulene synthase (SEQ ID NO:50), δ -selinene synthase (SEQ ID NO:48), e-b-farnesene synthase (SEQ ID NO:28), at residues whose α -carbons have the interatomic distances and structural coordinates described in Tables 1-6.

EXAMPLE 14 GENERATION OF NOVEL DITERPENE SYNTHASE GENES

A DNA sequence encoding an abietadiene synthase (SEQ ID NO:56) is used construct a library of mutant abietadiene synthases. Random mutations are introduced at nucleotides encoding one or more of the following nine amino acid residues: S, S, I, A, L, V, G, F and Y, which correspond to positions 593, 614, 722, 723, 724, 727, 761, 840 and 841 of SEQ ID NO:56.

In some cases, the abietadiene synthase coding sequence is mutated at nucleotides encoding one or more of amino acid residues I, S, T, M, D, L and T, which correspond to positions 590, 617, 618, 837, 845, 847 and 848 of SEQ ID NO:56. The abietadiene synthase coding sequence is sometimes mutated at nucleotides encoding one or more of the following amino acid residues: Y, S and N, which correspond to positions 696, 721 and 765 of SEQ ID NO:56. In some caes, these mutations are made in addition to mutations at the nine residues mentioned above. In other cases, mutations are made at these ten residues without introducing mutations at the nine residues mentioned above.

The abietadiene synthase coding sequence is mutated using the QuickChange® method in the pET28b(+) vector, following a protocol similar to that

described in Example 1 for the TEAS 406/407 random library. The primers used to generate mutations are synthesized as indicated in Example 11.

Specific mutations at one or more of the above abietadiene synthase amino acid residues are made by site-directed mutagenesis using a protocol similar to that described in Example 1 for TEAS.

Random and/or specific mutations are prepared in a manner similar to that described above to alter amino acid residues of other diterpene synthases at amino acid residues whose α -carbons have the interatomic distances and structural coordinates described in Tables 1-6, e.g., casbene synthase (SEQ ID NO:42) and taxadiene synthase (SEQ ID NO:44).

EXAMPLE 15

EXPRESSION OF MUTANT SYNTHASES IN INSECT, MAMMALIAN AND BACTERIAL CELLS

Constructs containing nucleic acids encoding mutant synthases of Examples 12, 13 and/or 14 are introduced into cultured cells of the insect *Spodoptera frugiperda* using a baculovirus expression vector. After expression of the gene, the mutant enzyme is isolated and purified from each clone.

Constructs containing nucleic acids encoding mutant synthases of Examples 12, 13 and/or 14 are introduced into cultured HeLa cells using an expression vector having an SV40 promoter. After expression of the gene, the mutant enzyme is isolated and purified from each clone.

Constructs containing nucleic acids encoding mutant synthases of Examples 12, 13 and/or 14 are introduced into *E. coli* BL-21 on a plasmid vector as described in Example 1. The mutant synthase gene is expressed and the mutant enzyme is isolated and purified as described in Example 2.

OTHER EMBODIMENTS

To the extent not already indicated, it will be understood by those of ordinary skill in the art that any one of the various specific embodiments herein described and illustrated may be further modified to incorporate features shown in other of the specific embodiments.

It is to be understood that while the invention has been described in conjunction with the Detailed Description thereof, that the foregoing description is

intended to illustrate, and not limit the scope of the invention, which is defined by the scope of the appended claims. Other aspects, advantages, and modifications are within the scope of the following claims.
